

# From gene expression du genetic network

**Françoise Monéger**

Laboratoire de Reproduction et Développement des Plantes  
Ecole Normale Supérieure de Lyon

**My name is** Françoise Monéger

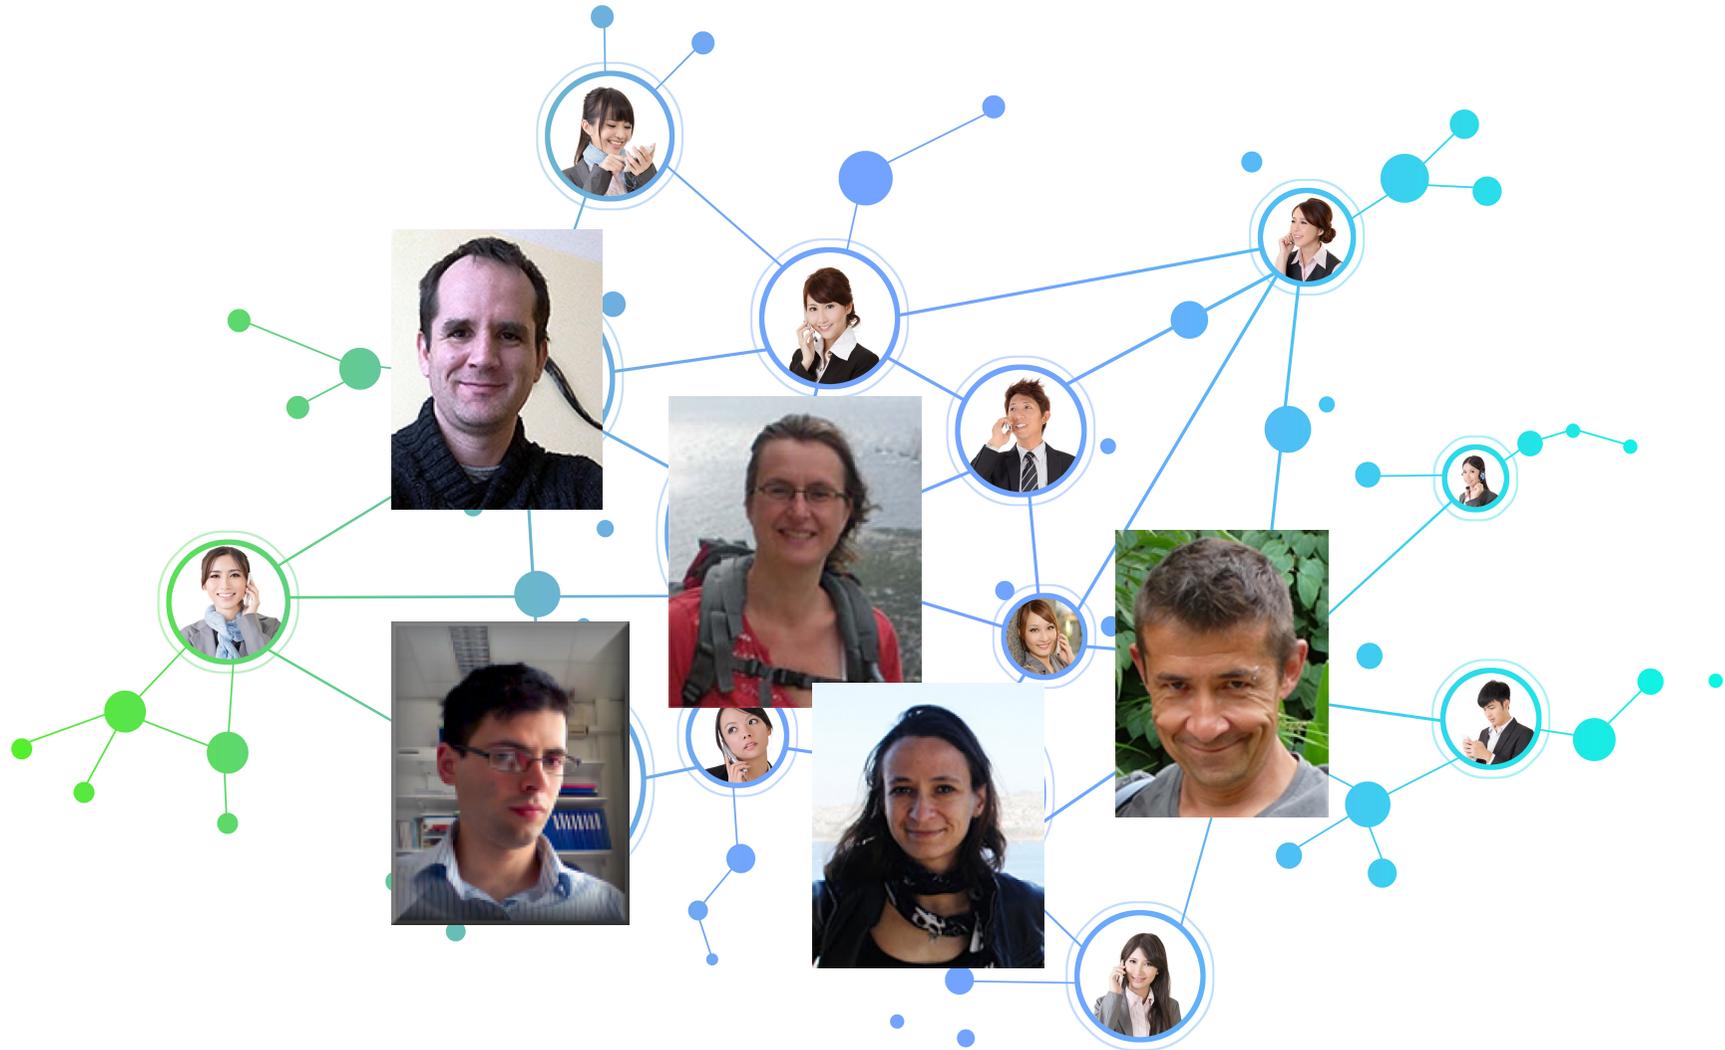

**I work at** Ecole Normale Supérieure de Lyon in the  
Laboratory Plant Reproduction and development

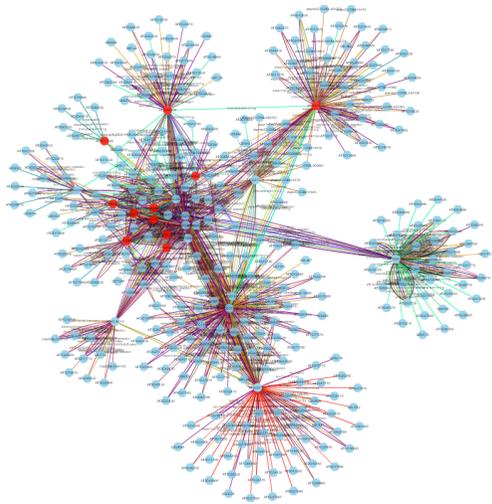

**I am good at** developing molecular approaches to understand flower  
development, in particular identifying targets of transcription factors  
controlling flower development

**I am interested in** investigating how modeling of gene regulatory  
networks can help biologists to increase their knowledge of their  
favorite biological system

**I come mainly for** sharing my experience of gene regulatory networks,  
learn from others who have a different approach of these networks,  
in particular with statistical tools

# Networks are everywhere!

**If one of these questions is of interest to you,  
stay with us !!**

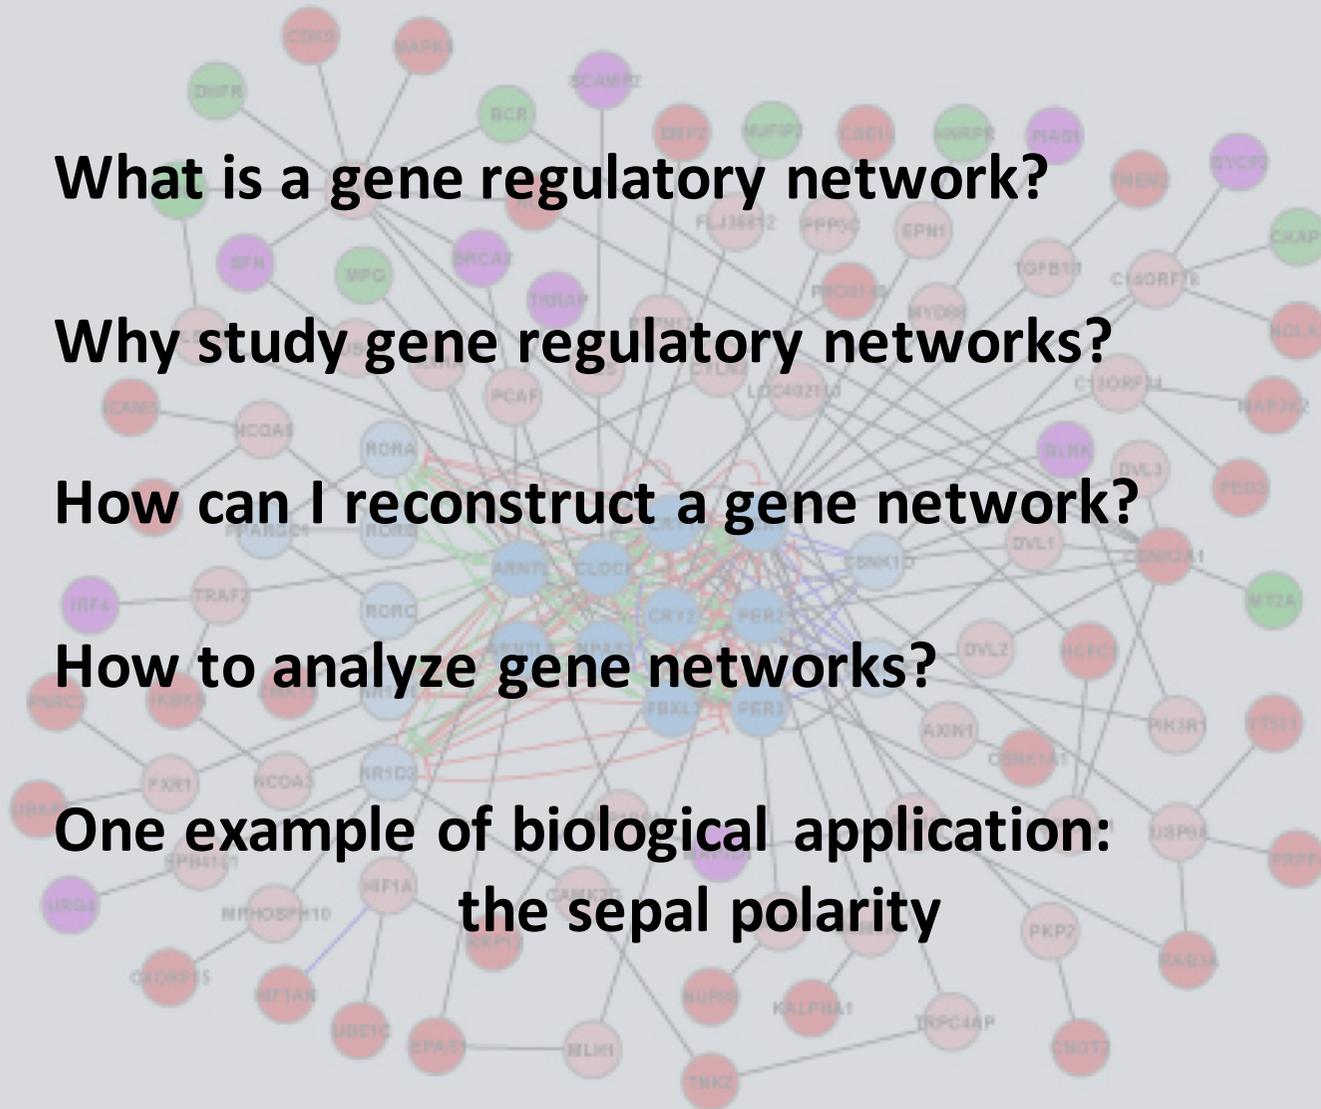

**What is a gene regulatory network?**

**Why study gene regulatory networks?**

**How can I reconstruct a gene network?**

**How to analyze gene networks?**

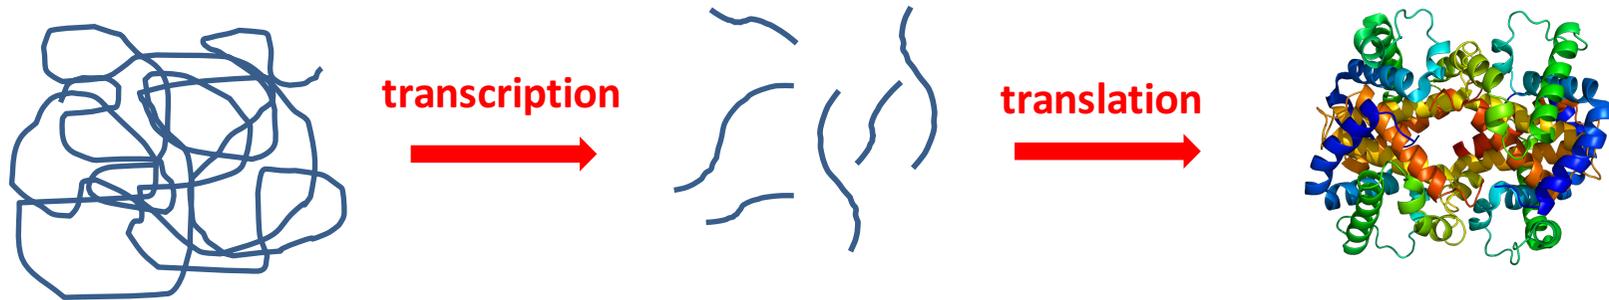

**One example of biological application:  
the sepal polarity**

# 1- What is a gene regulatory network?

A **gene (or genetic) regulatory network (GRN)** is a collection of molecular regulators that interact with each other and with other substances in the cell to govern the expression levels of mRNA and proteins. These play a central role in morphogenesis, the creation of body structures, which in turn is central to evolutionary developmental biology (evo-devo).

# Data to construct gene regulatory networks?

DNA  
(genes)

RNA  
(transcripts)

Proteins

Identified by sequencing

Identified by RT-PCR,  
RNA-SEQ, micro-array,  
*in situ* hybridization

Identified by  
immunodetection,  
mass spectrometry,  
immunolocalization

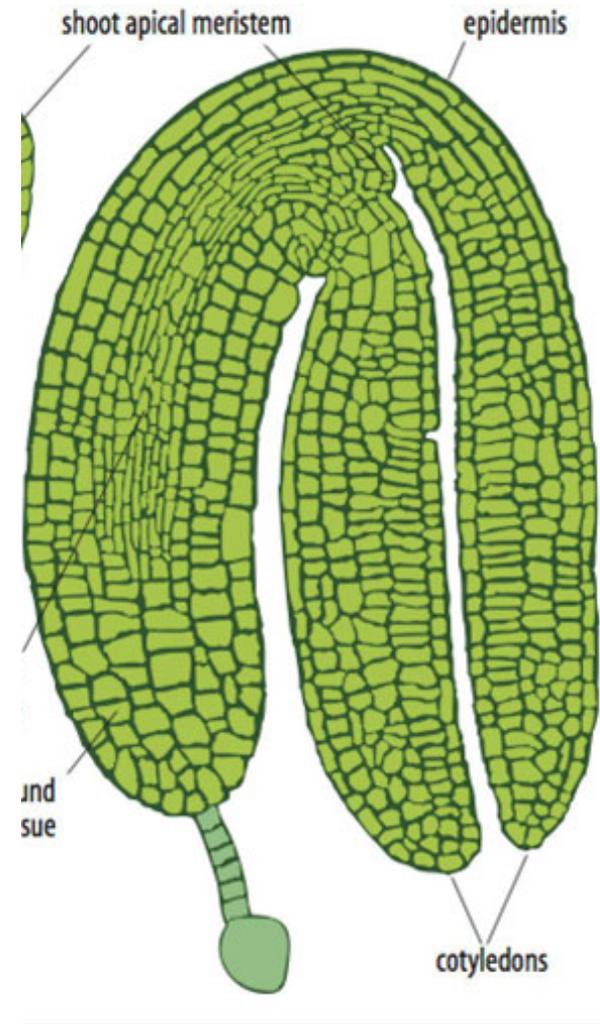

# Data to construct gene regulatory networks?

RNA-SEQ, microarrays, RT-PCR  
require RNA extraction

Immunodetection and mass spectrometry  
require protein extraction

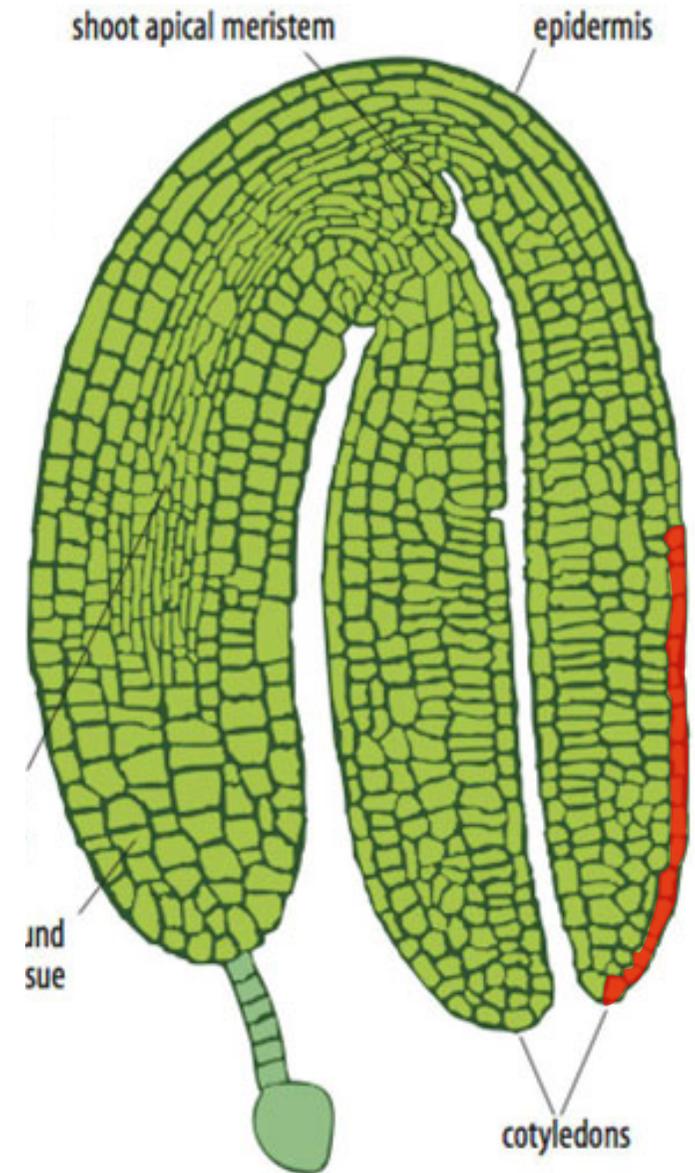

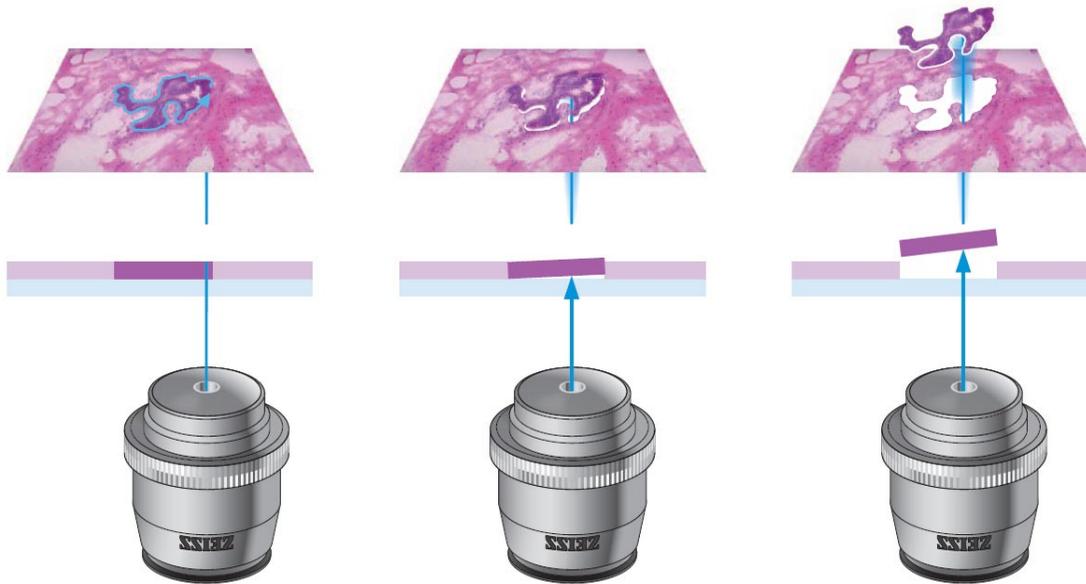

Cells with different transcriptome and proteome  
will be mixed together

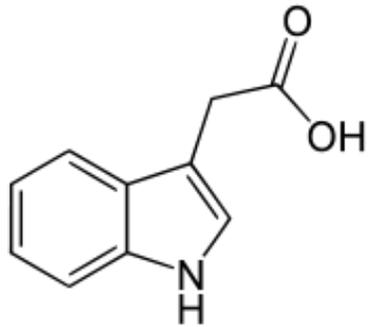

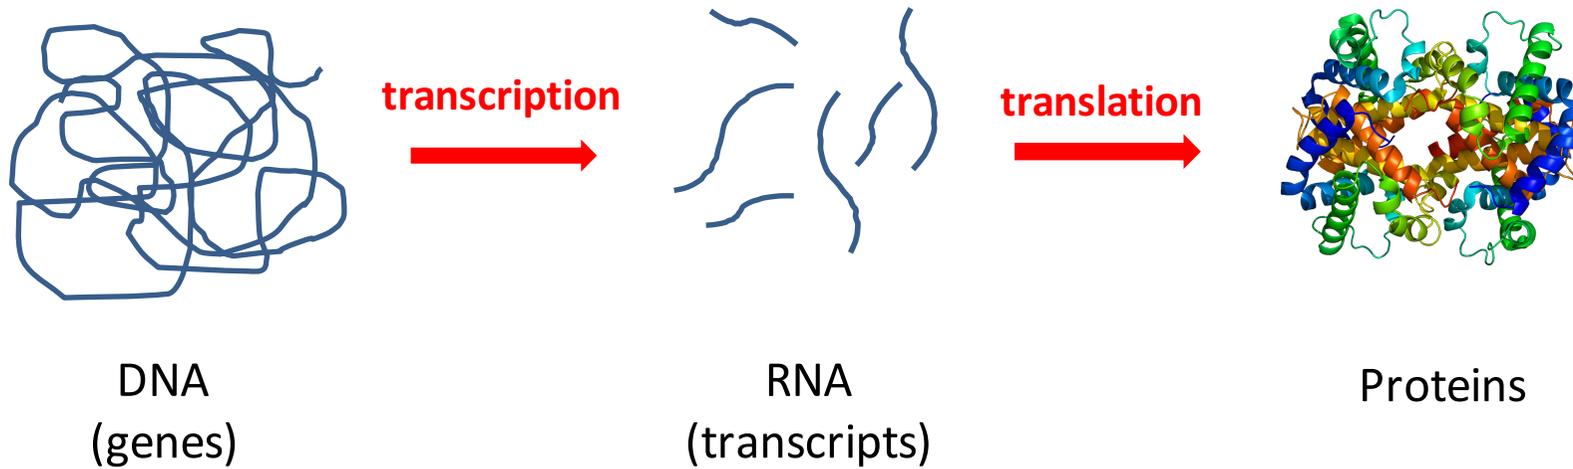

# Data to construct gene regulatory networks?

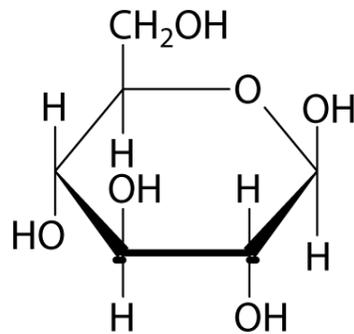

Possible improvement  
by laser microdissection  
(LCM)

# Data to construct gene regulatory networks?

Hormones

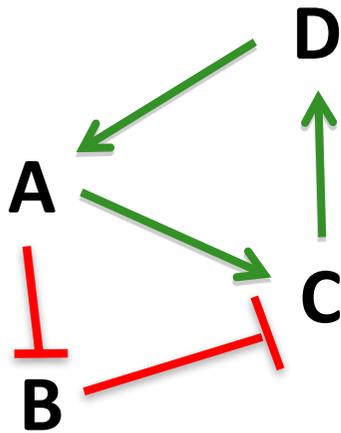

Sugars

Metabolites, Ca<sup>++</sup>, pathogens, stress...

# How to represent gene regulatory network?

**Gene regulatory networks** are commonly represented as graphs of interactions: the nodes are connected by interactions.

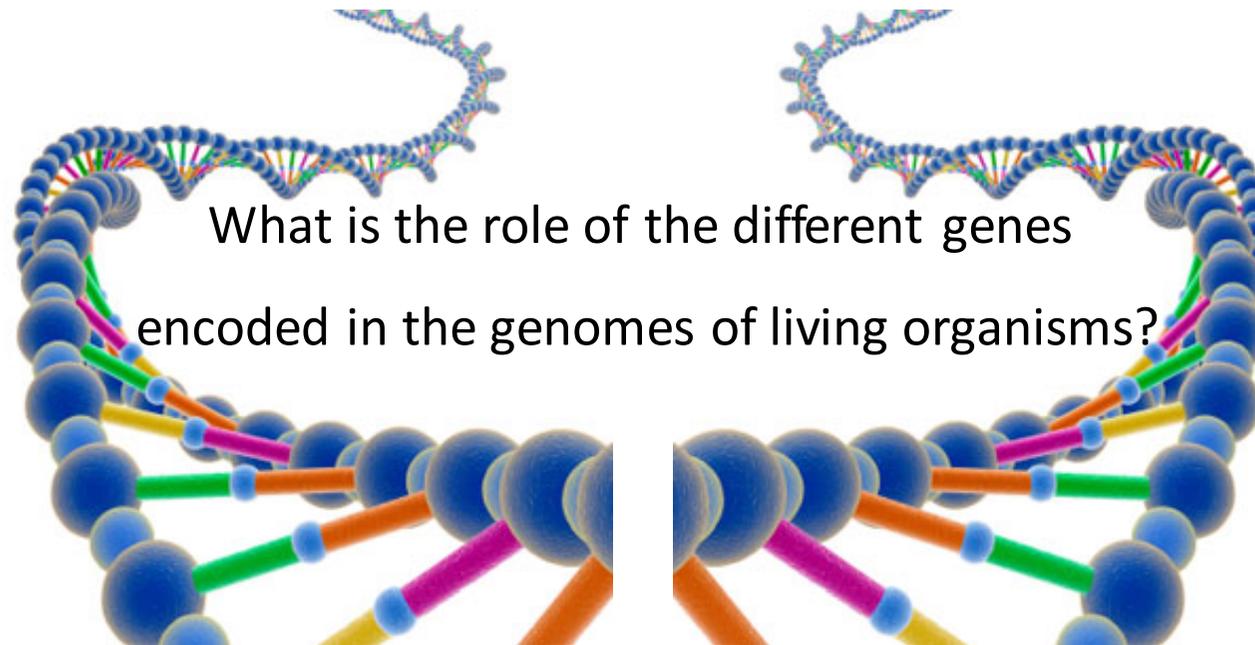

A node can be any molecule but often represents DNA, RNA, protein or complex of them

The interactions can be direct or indirect

The interactions are oriented > circuit

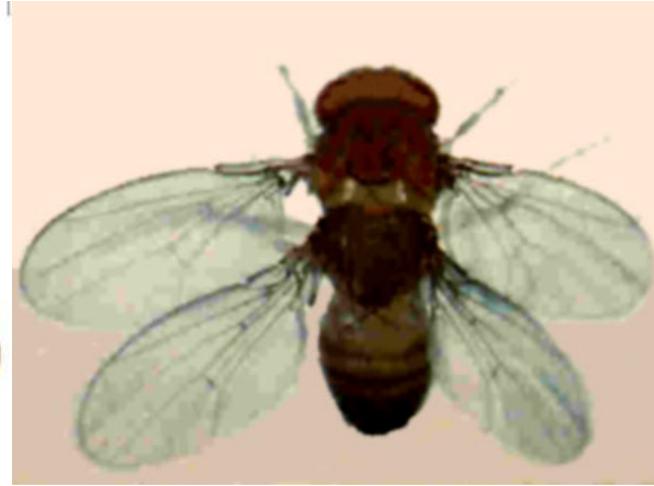

## 2- Why study gene regulatory networks?

**To answer this question, biologists have a robust method:  
they inactivate a given gene and see what it does**

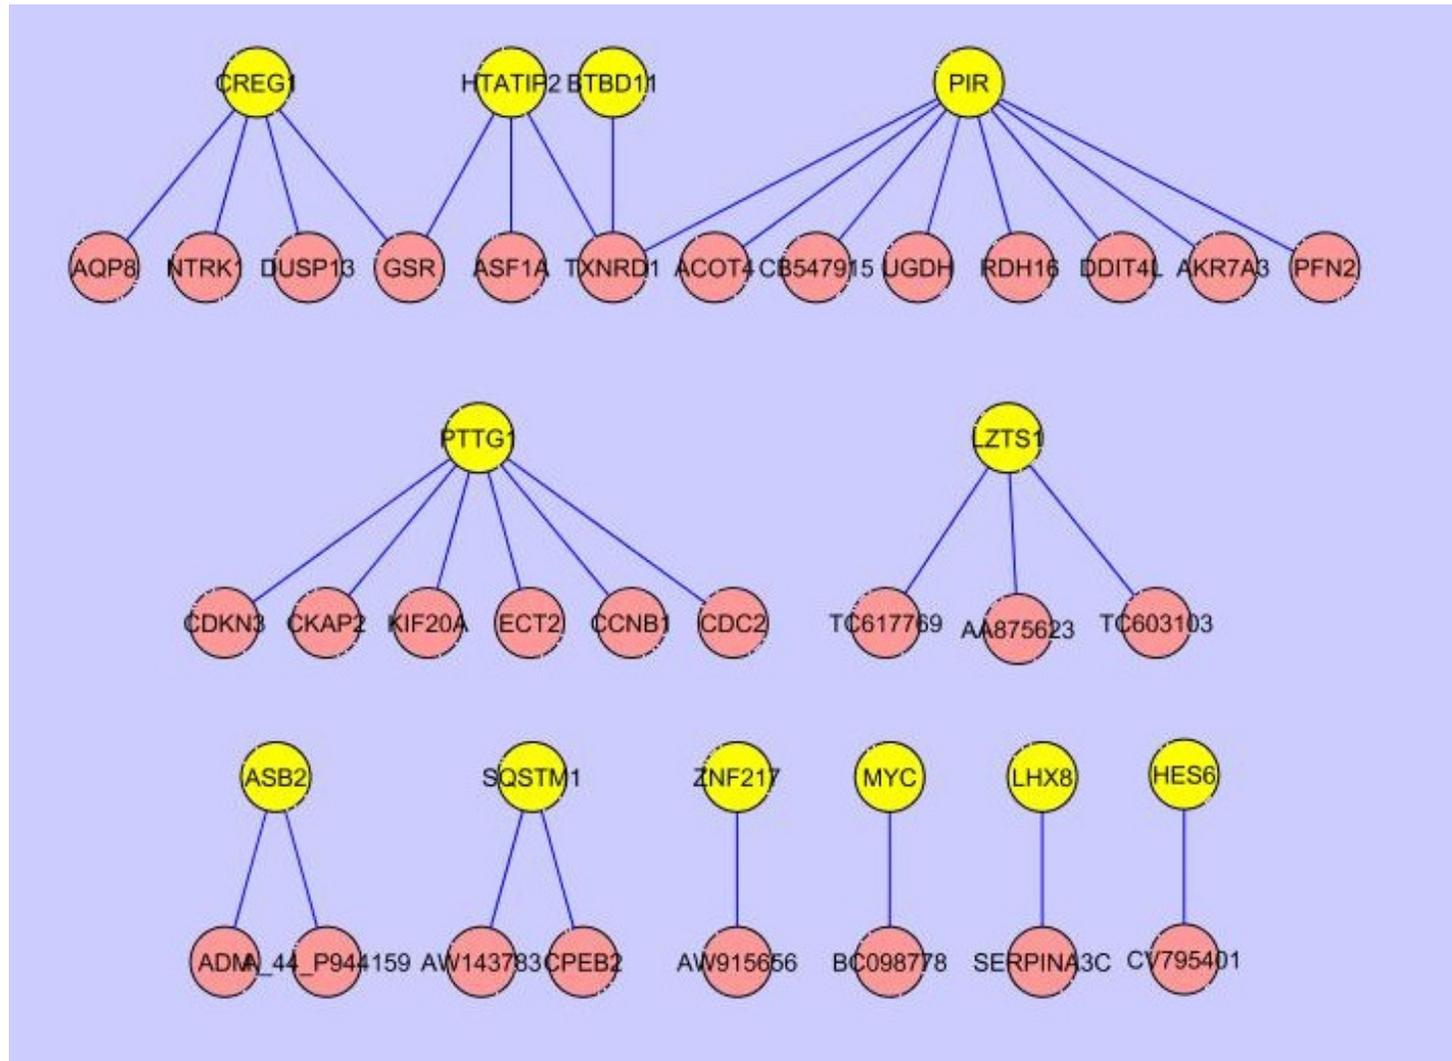

## Genetic approaches widely used since the 80's

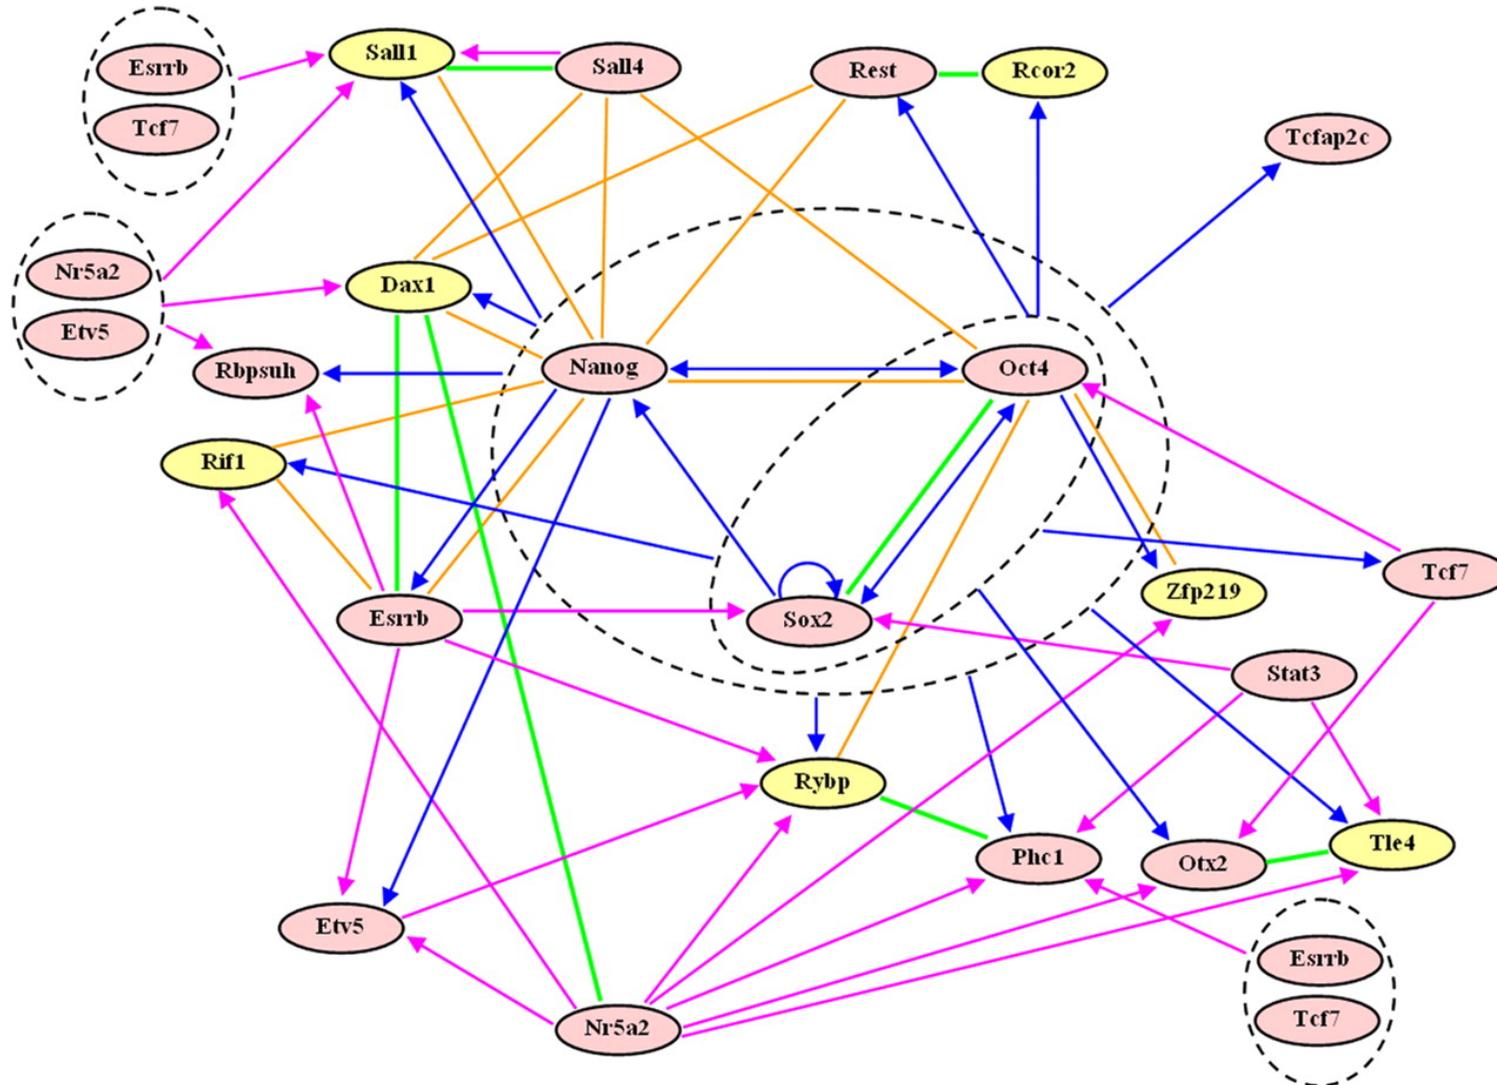

These approaches give an impression of verticality:

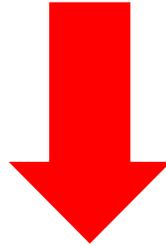

**1 gene / 1 phenotype**

However, biological processes are controlled by gene regulatory networks rather than isolated genes

**Living cells are self-organising systems**

**This self-organization is encoded in the properties  
of the gene regulatory networks:**

- **Each element is doing something on another**
- **Each element is itself regulated by another**
- **Presence of closed regulatory circuits**

**Is it clear what is a gene regulatory network ?**

**Why it is important to study them ?**

### **3- How can I reconstruct a gene network?**

### 3- How can I reconstruct a gene network?

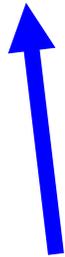

**Many different ways !!**

# **Reconstruction of a gene network: the different steps**

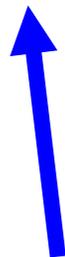

- Define a given process to study**
- List the regulatory elements known to participate**
- List the interactions linked to these elements**

# Reconstruction of a gene network: the different steps

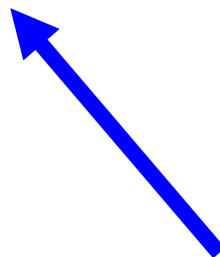

Source	Destination	Action	Experimental evidence	Reference
ARF4p	FILa	+G	RT-PCR analyses showed that FILAMENTOUS FLOWER (FIL) is up-regulated in plants over-expressing ARF4, while it is repressed in arf4-2 mutant	Yoon et al, 2009

**Consider the nature of the interaction: why?**

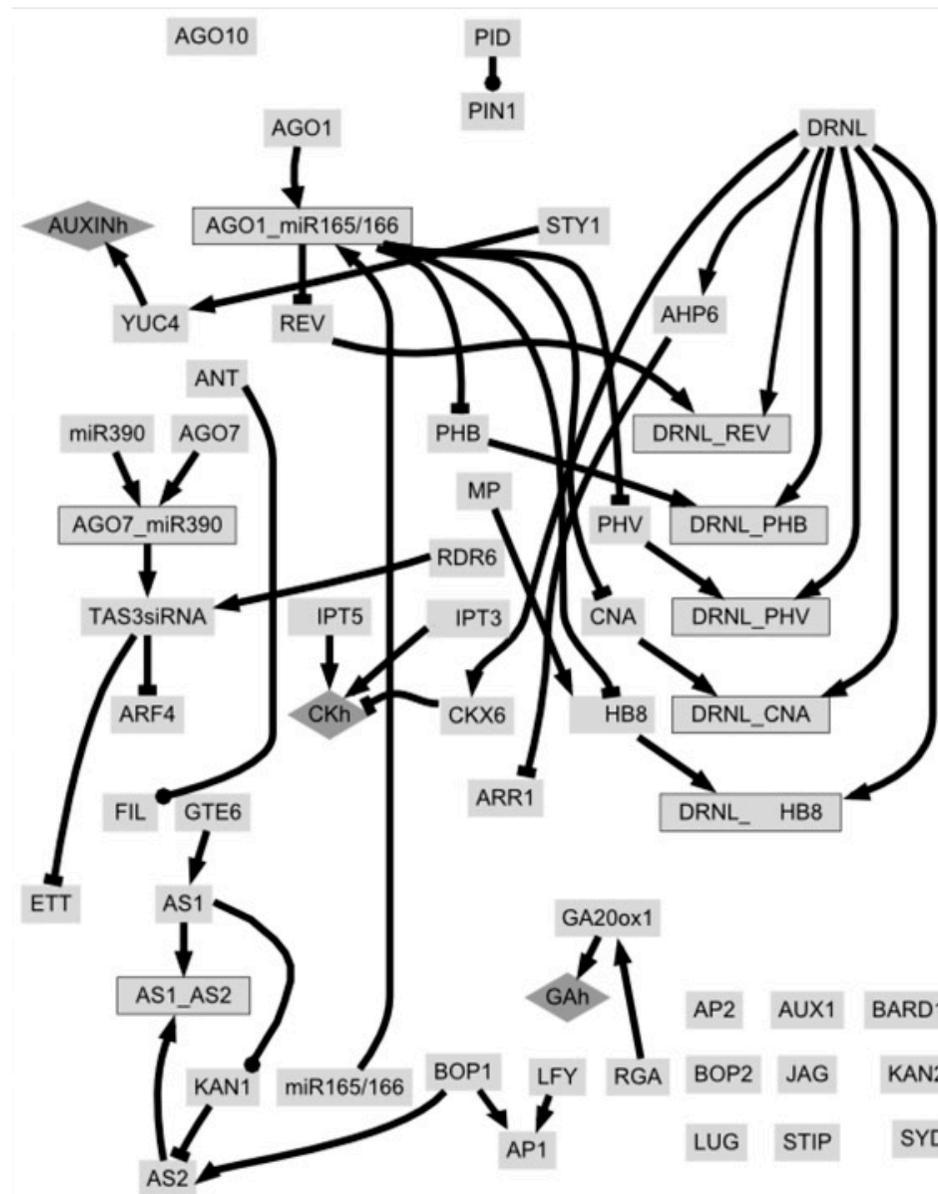

**Risk of redundancy if you mix direct and indirect interactions**

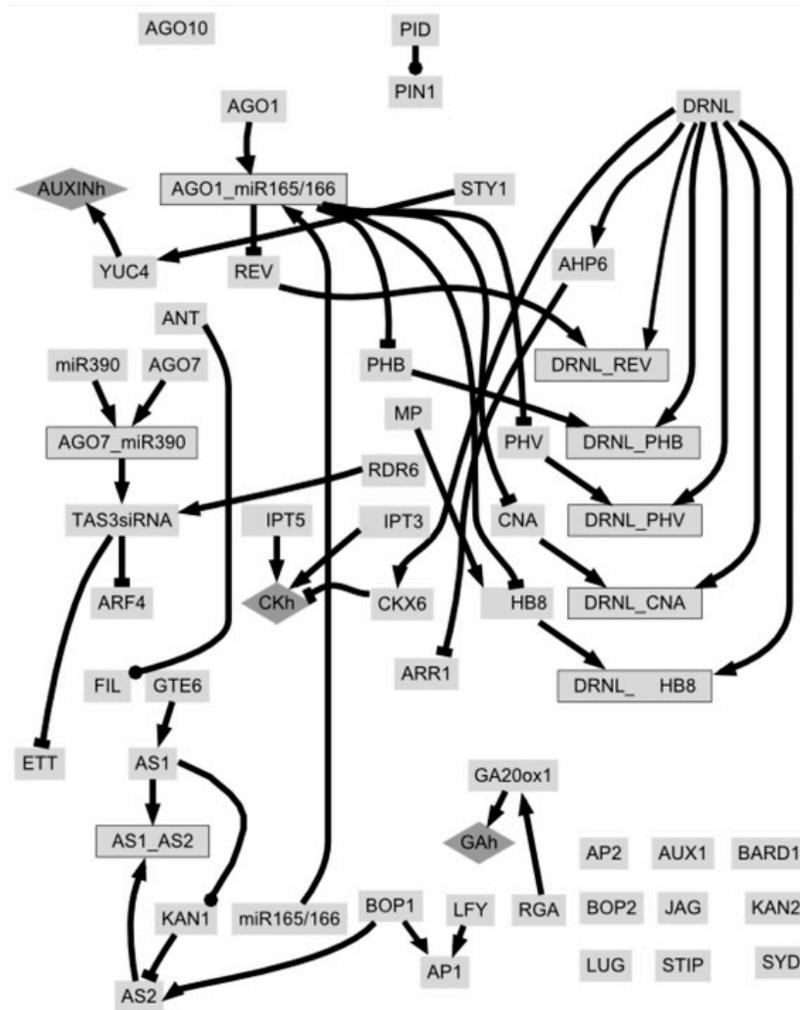

# **Evaluate the reliability of experimental data**

- **Accumulation of different technics to support the interaction**
- **Contradicting data between different labs?**

From this list, you can draw a graph

# It appears that information is lacking

Some elements have no input

Some elements have no output

There is no closed circuits

**A biological network  
must have  
all these properties!**

## **Solution 1**

Try to fill the gaps > back to the literature or to the bench

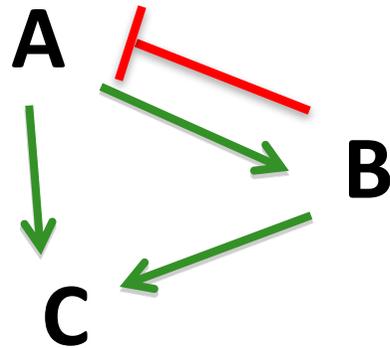

## **Solution 2**

focus on a subset of interactions  
for which requirements are fulfilled

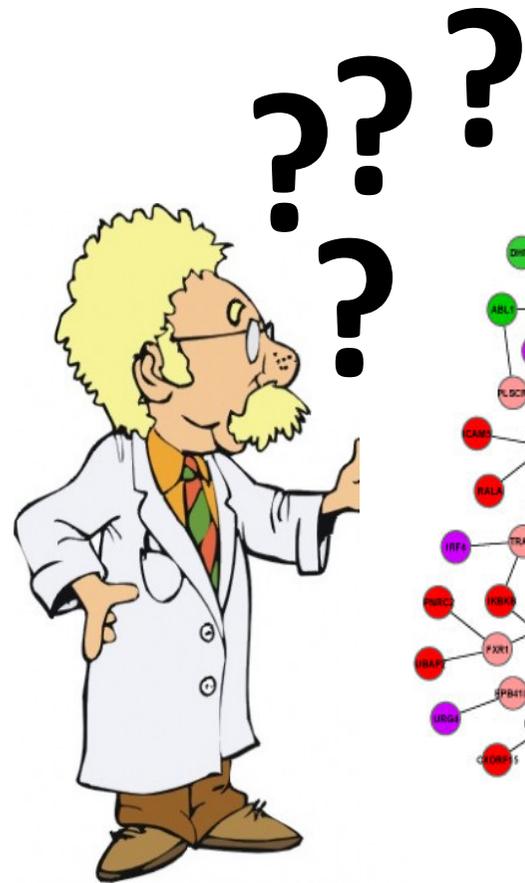

- inputs for all the elements
- closed circuits

**Once the minimal properties are fulfilled**

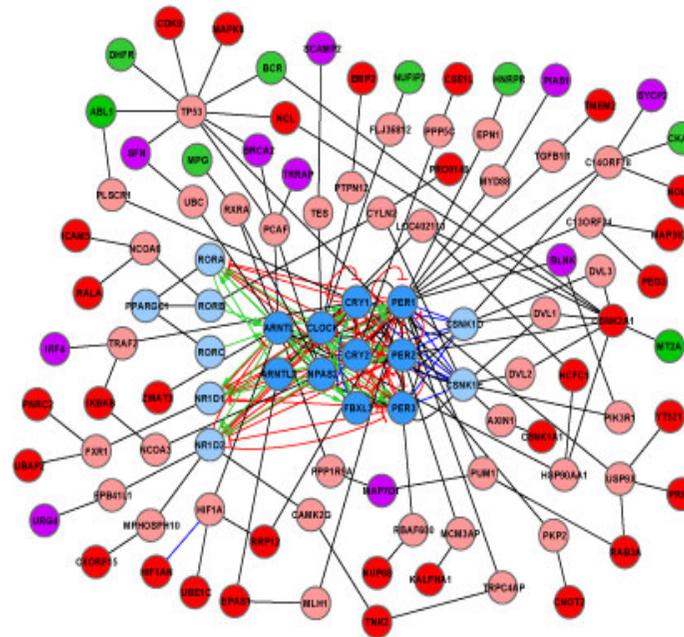

**Modeling can reveal the behaviors of your network**

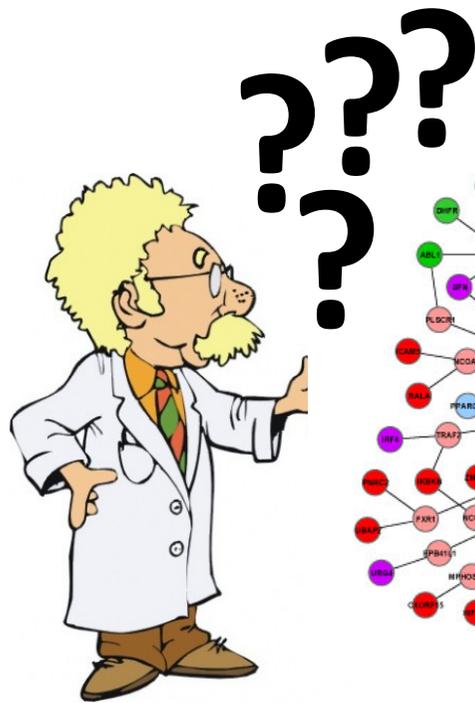

# 4- How to analyze gene networks?

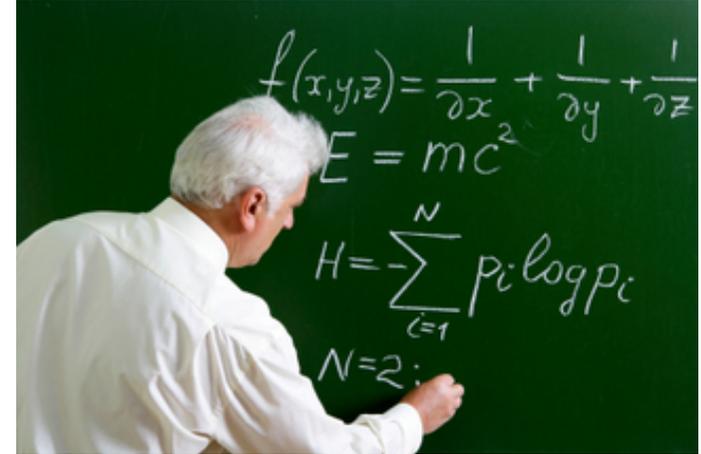

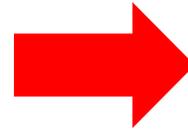

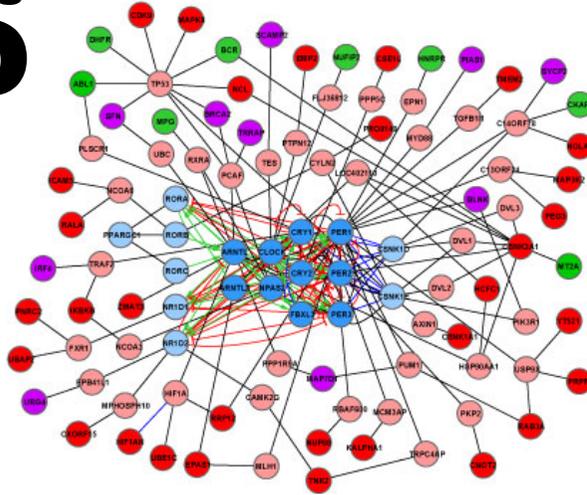

**Biologist**

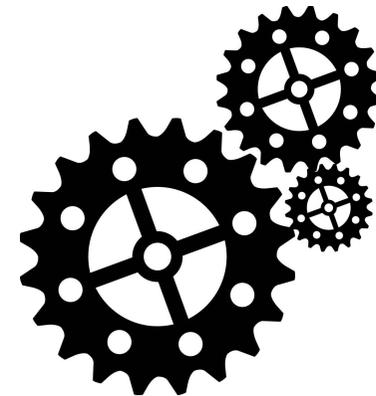

# Main wrong preconceived idea

Biologist

Mathematician

**A model in itself is useless**

**It is by building the model that you learn how your system works!**

**It's like coffee again !!!**

**Many methods exist to model gene regulatory networks**

# Quantitative models

**Require informations we usually don't have**  
(half life for RNA and proteins, concentrations...)

**Heavy in terms of computing time**

**Can only compute small networks**

**Require technical skills (differential equations)**

# Boolean network

**Definition:** A **Boolean network** consists of a discrete set of Boolean variables each of which has a Boolean function (possibly different for each variable) assigned to it which takes inputs from a subset of those variables and output that determines the state of the variable it is assigned to.

# Boolean network

**Drawbacks:** the nodes can only be ON or OFF (1 or 0)

**Advantages:**

- easy to use
- can be applied to big networks
- compatible with most biological data which are often  
not quantitative

# How does it work? It uses logical tables

Stable state with all elements OFF unless A is ON > cycle

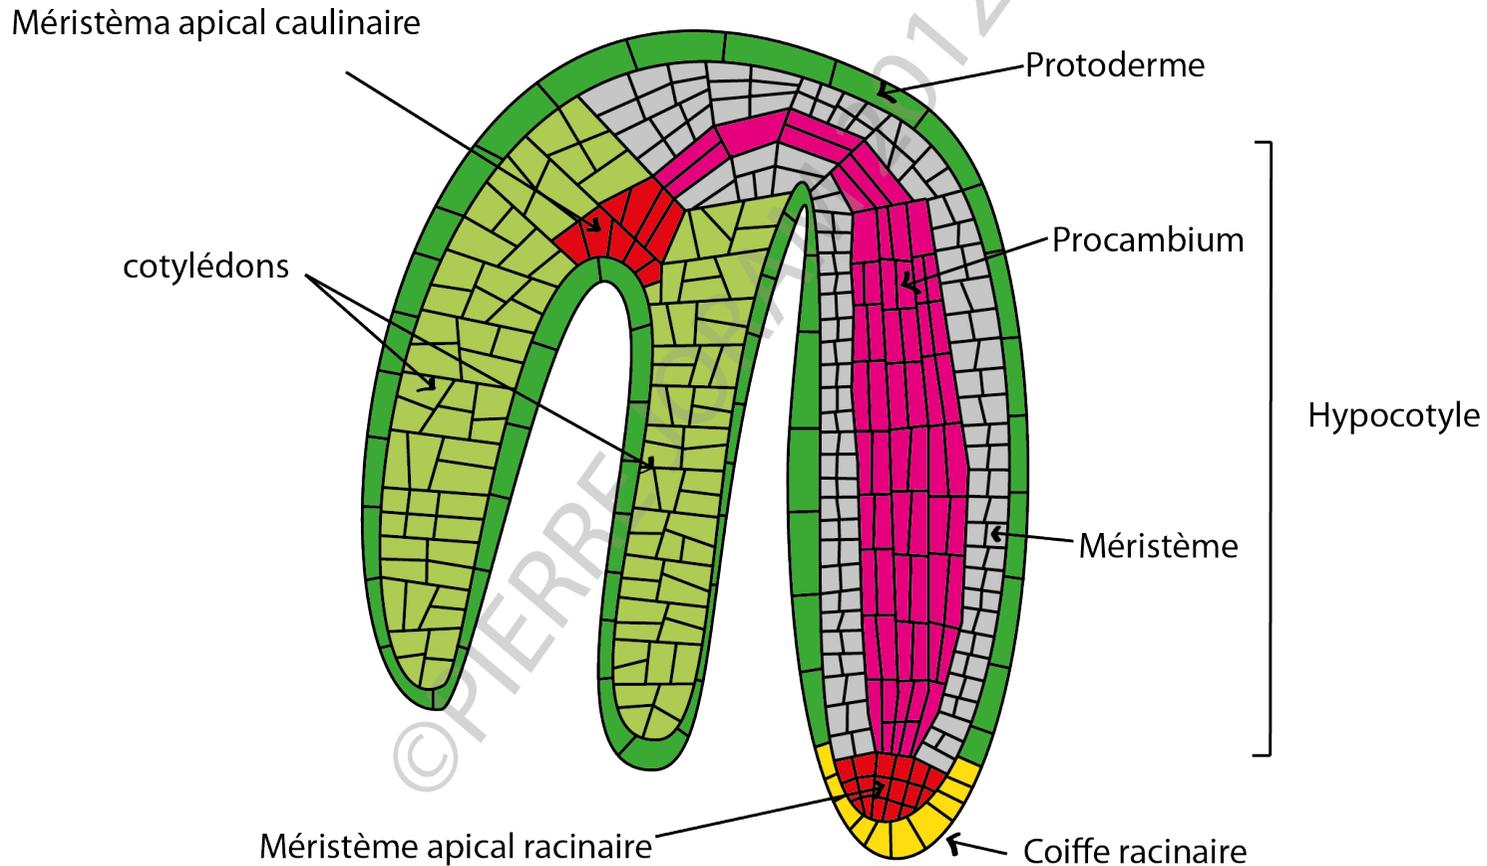

**The interaction network is the same in all the cells  
but the state can be different**

**Communication between cells affect the state of the network**

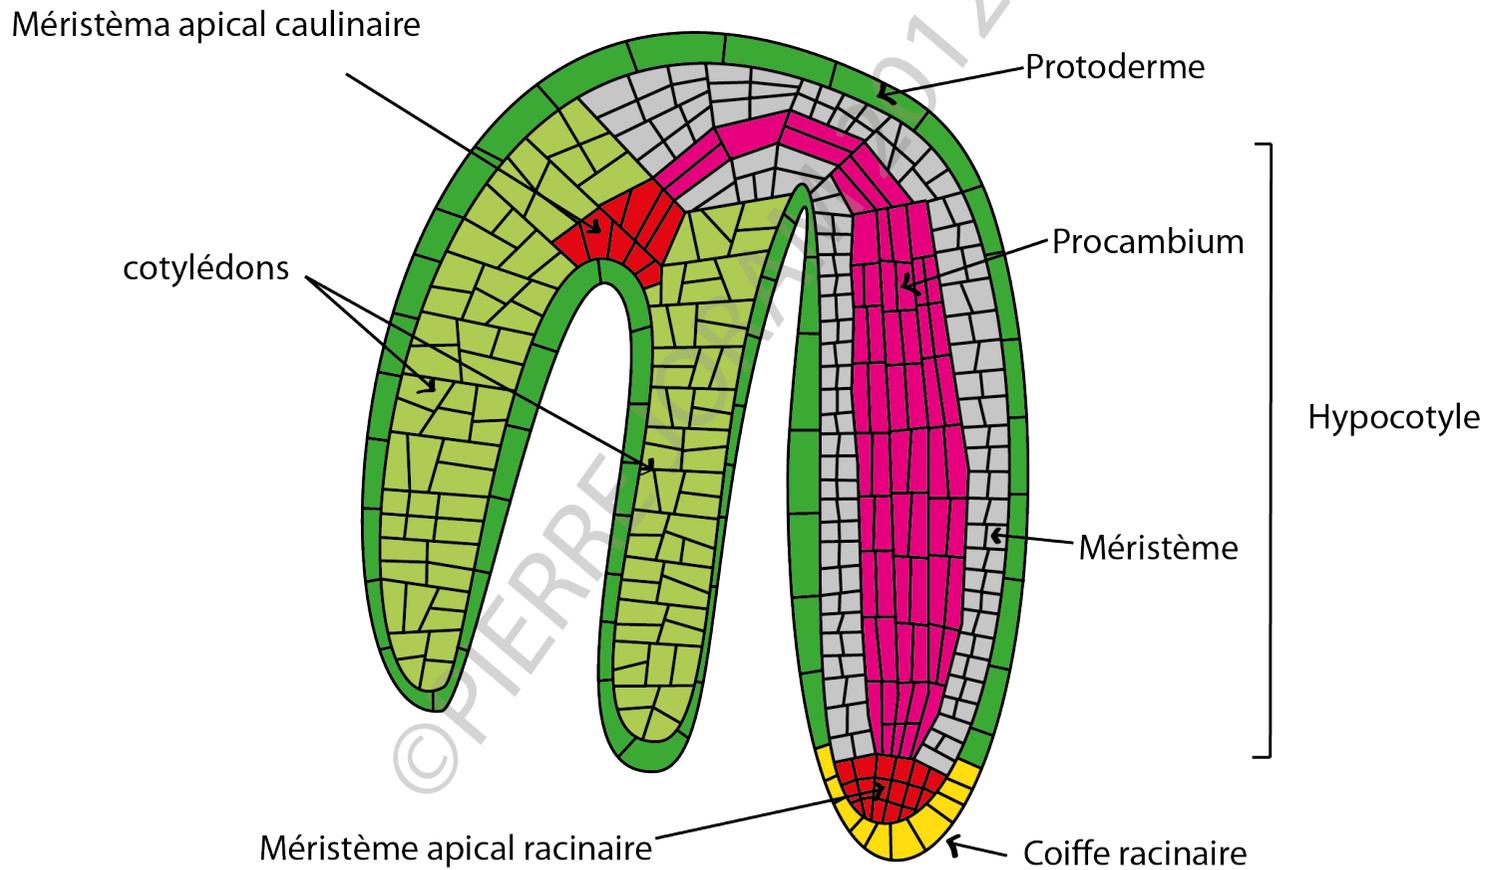

**Examples?**

# Back to biology and steady states

**The steady states correspond to the molecular state of a cells**

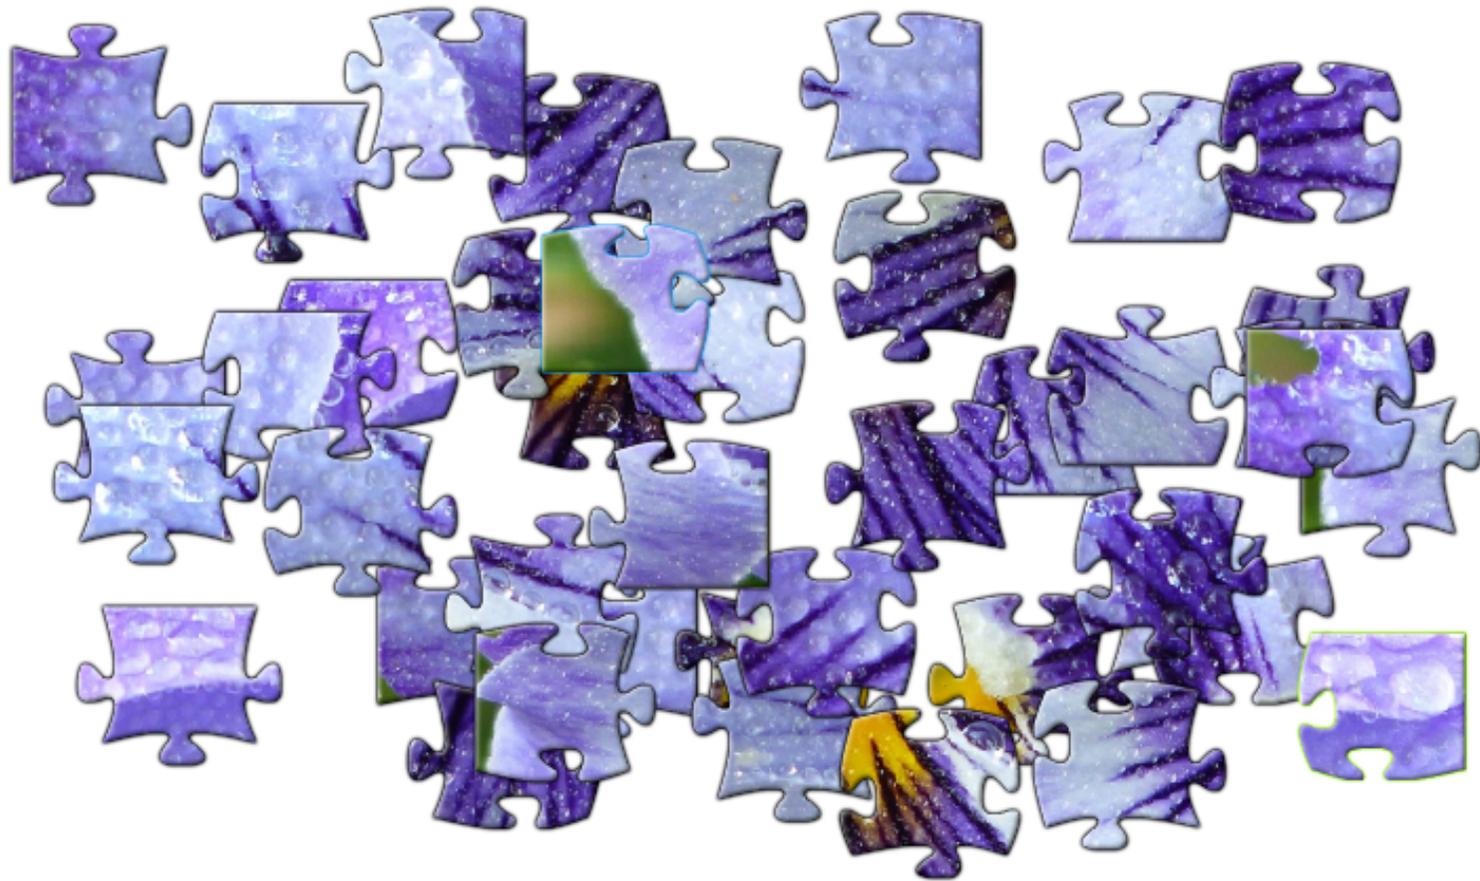

# Development can be seen as a succession of molecular steady states evolving through time autonomously

**Time for break**

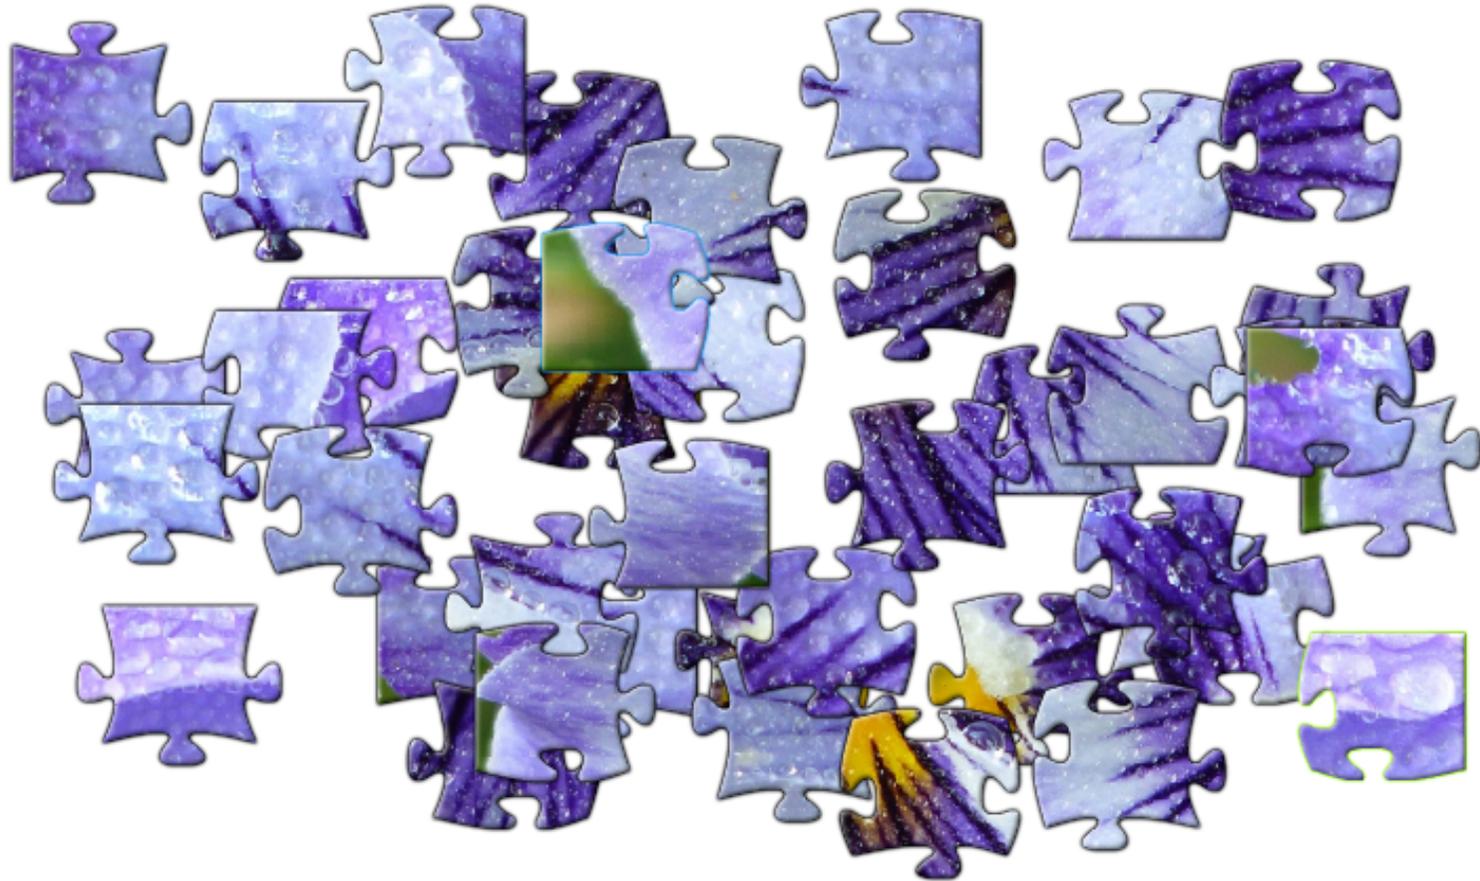

# One example of biological application: the sepal polarity

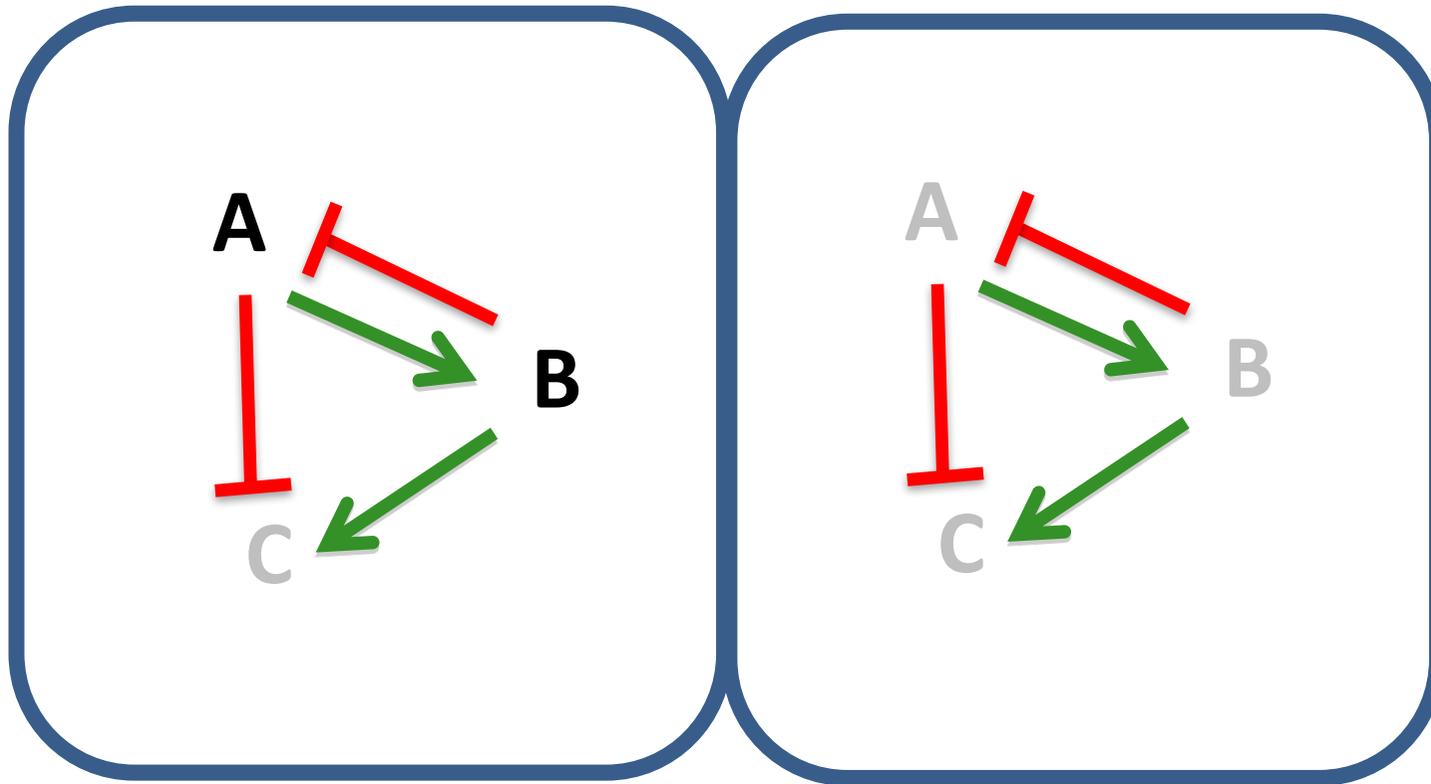

Increasing the number of pieces does not necessarily increase our knowledge

# How to integrate heterogeneous data in a coherent manner?

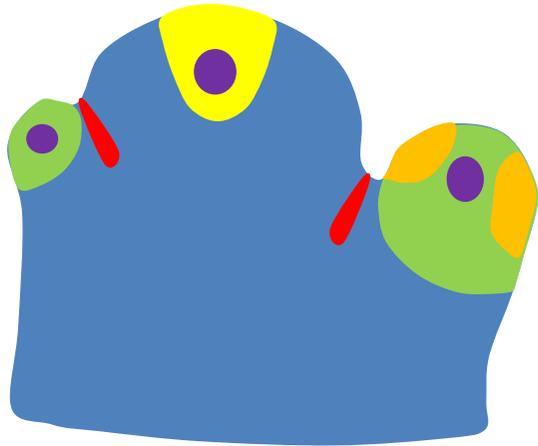

**The interaction network is the same in all the cells  
but the state can be different**

**Communication between cells affect the state of the network**

# How to construct a network which is coherent with expression patterns and long range interactions?

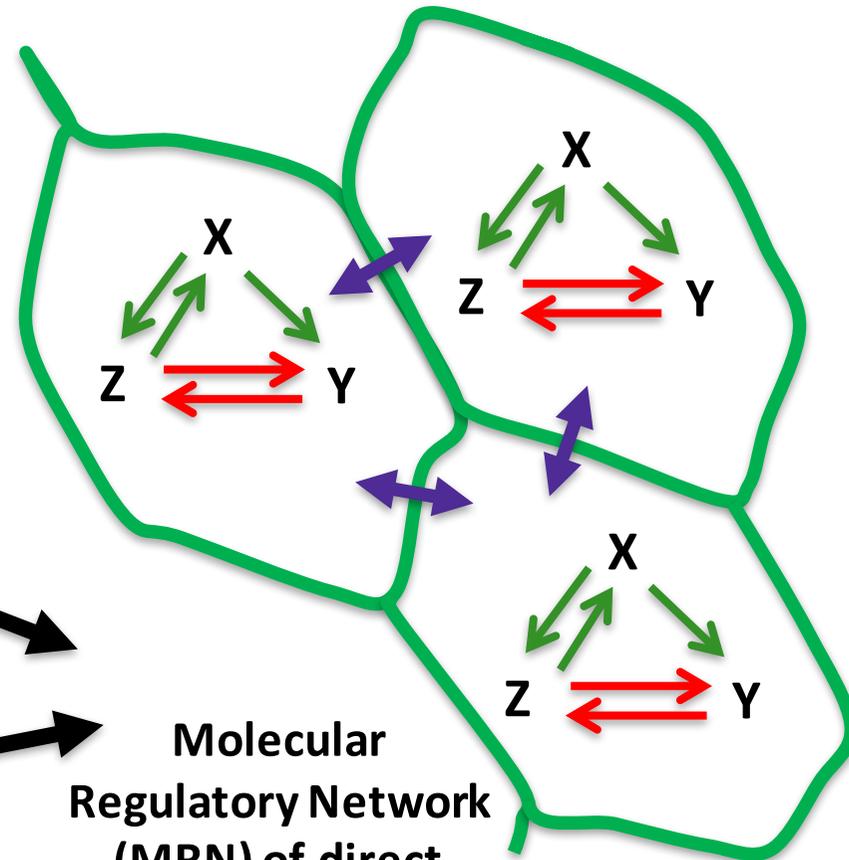

**behavior**

Expression patterns  
(steady states)

Long range  
interactions

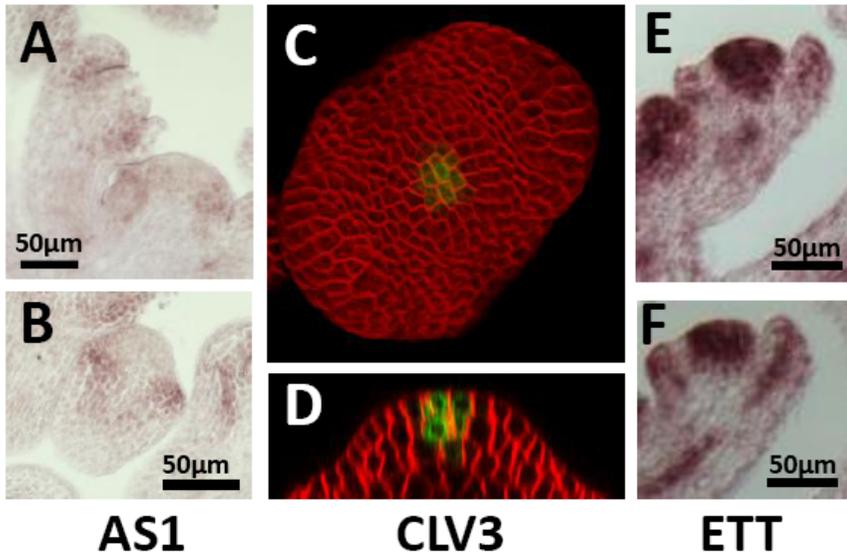

**structure**

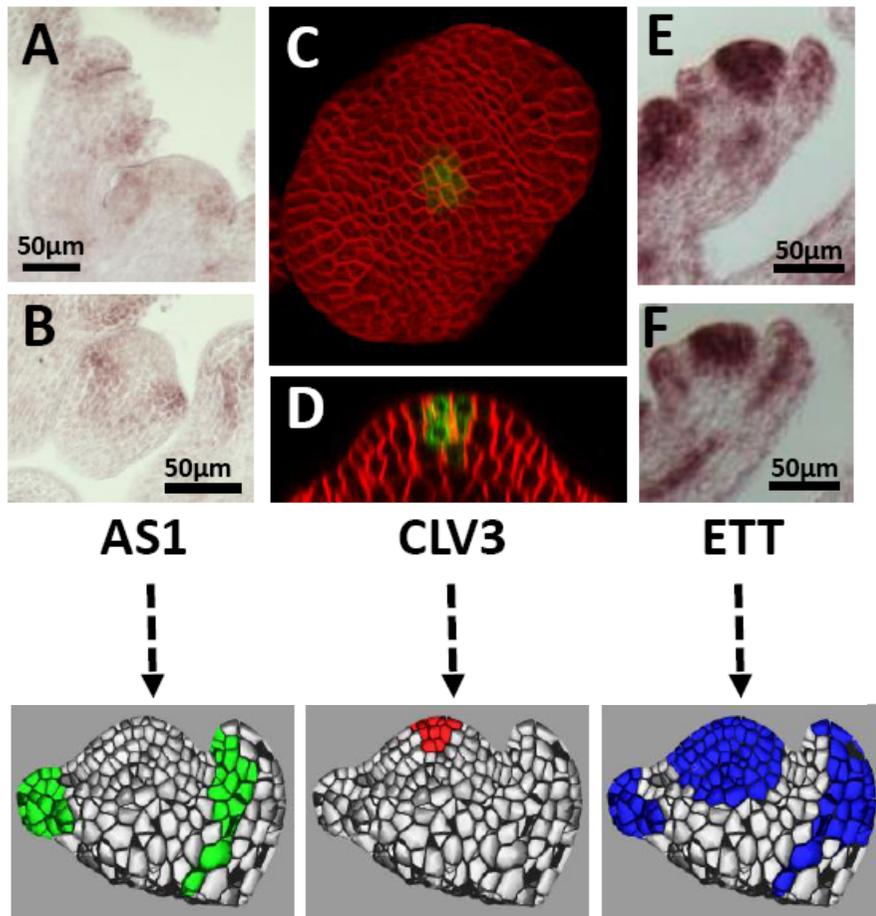

Molecular  
Regulatory Network  
(MRN) of direct  
interactions

ex: Z and Y are not expected  
to be co-expressed

Superimposition

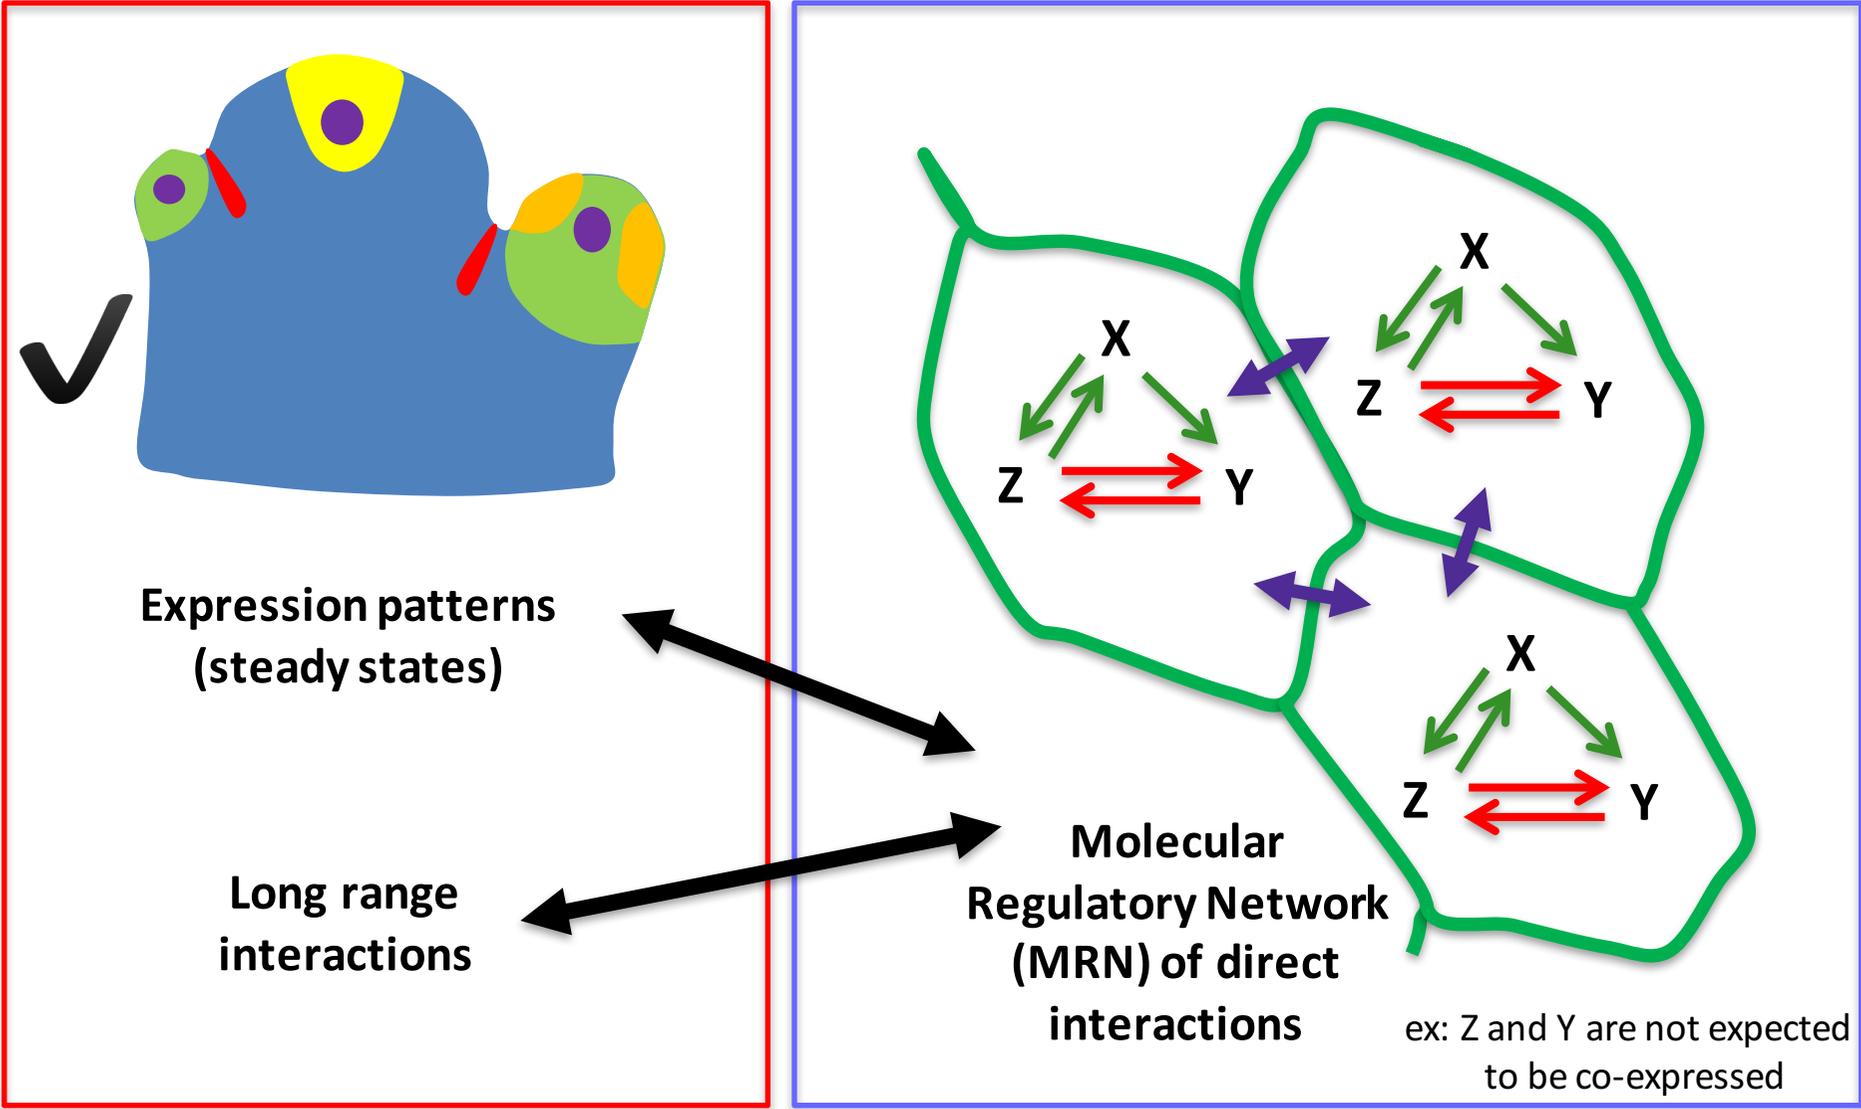

# 35 genes projected

# 6 molecular states with 35 elements

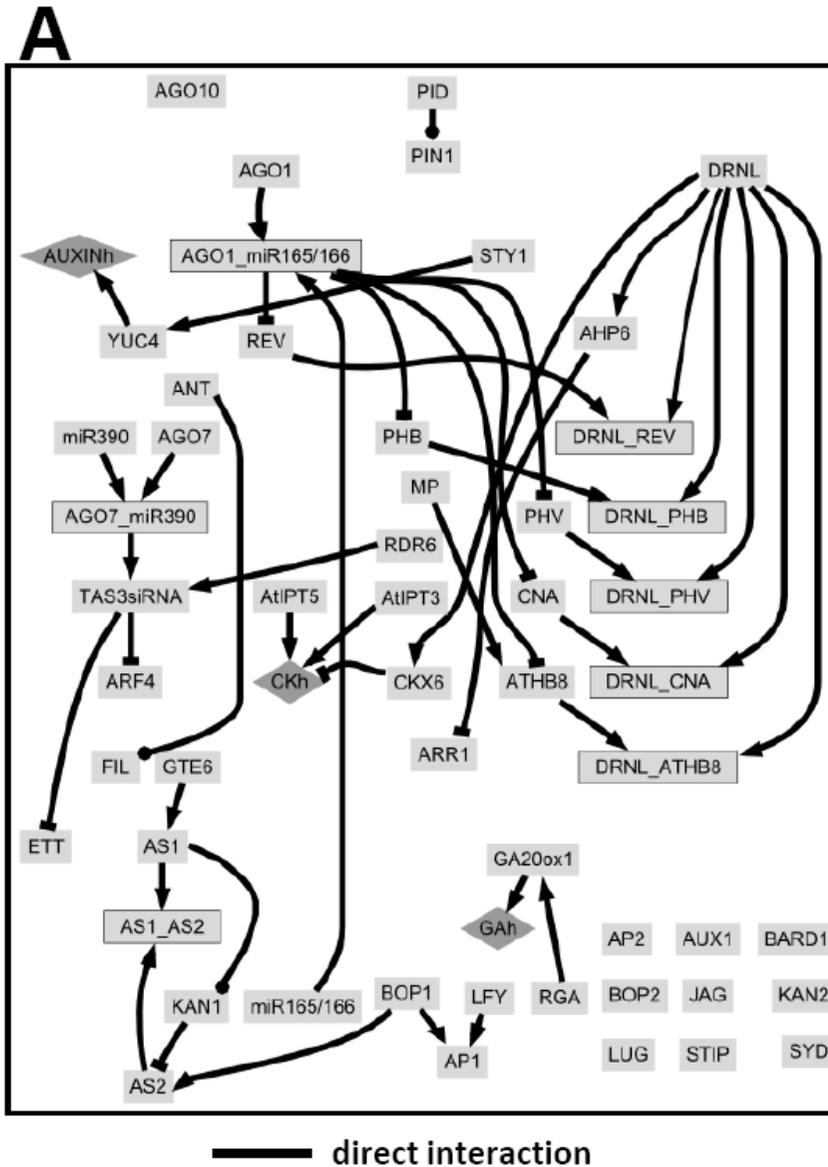

**Objective: construct a network which is coherent with expression patterns and long range interactions**

**behavior**

**structure**

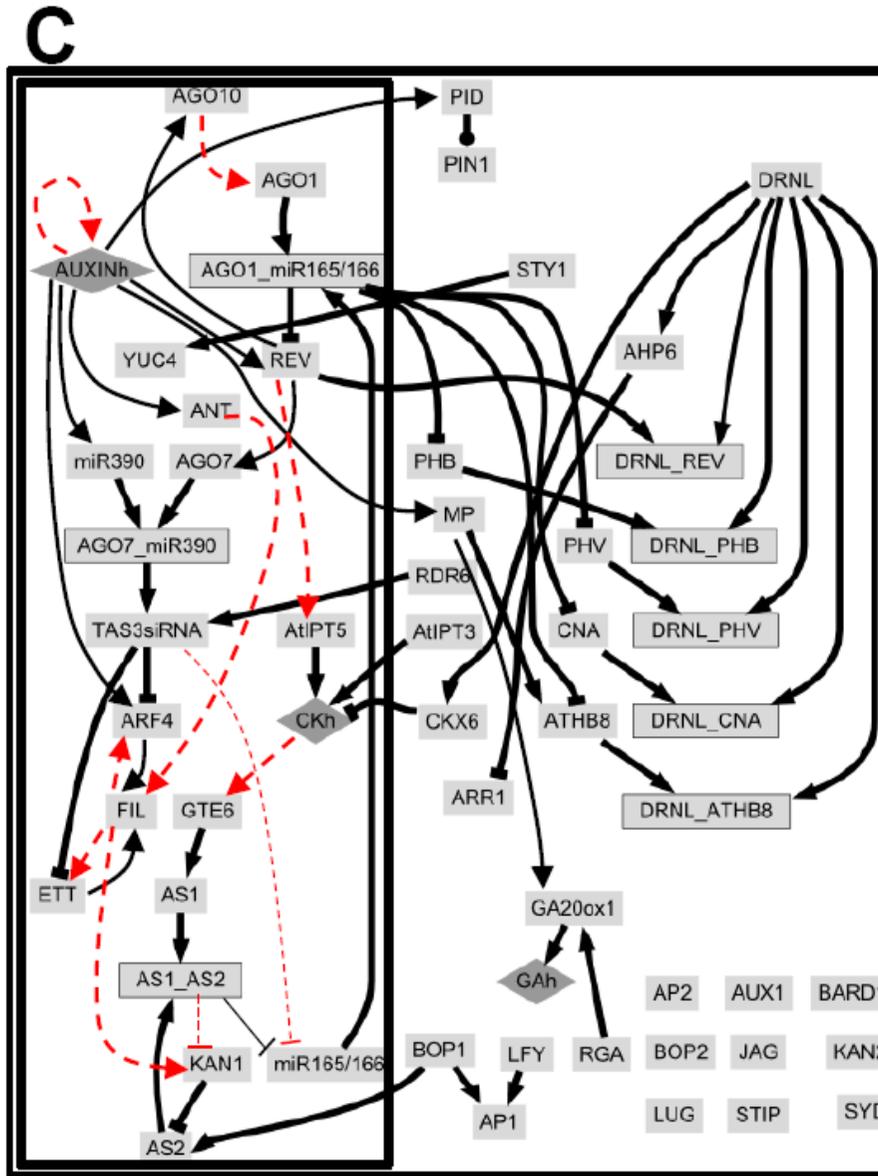

# Candidate molecular interaction graph (using direct interactions)

## Theoretical requirements

- close circuits
- inputs for each element

# We can make hypotheses to fulfill requirements: how?

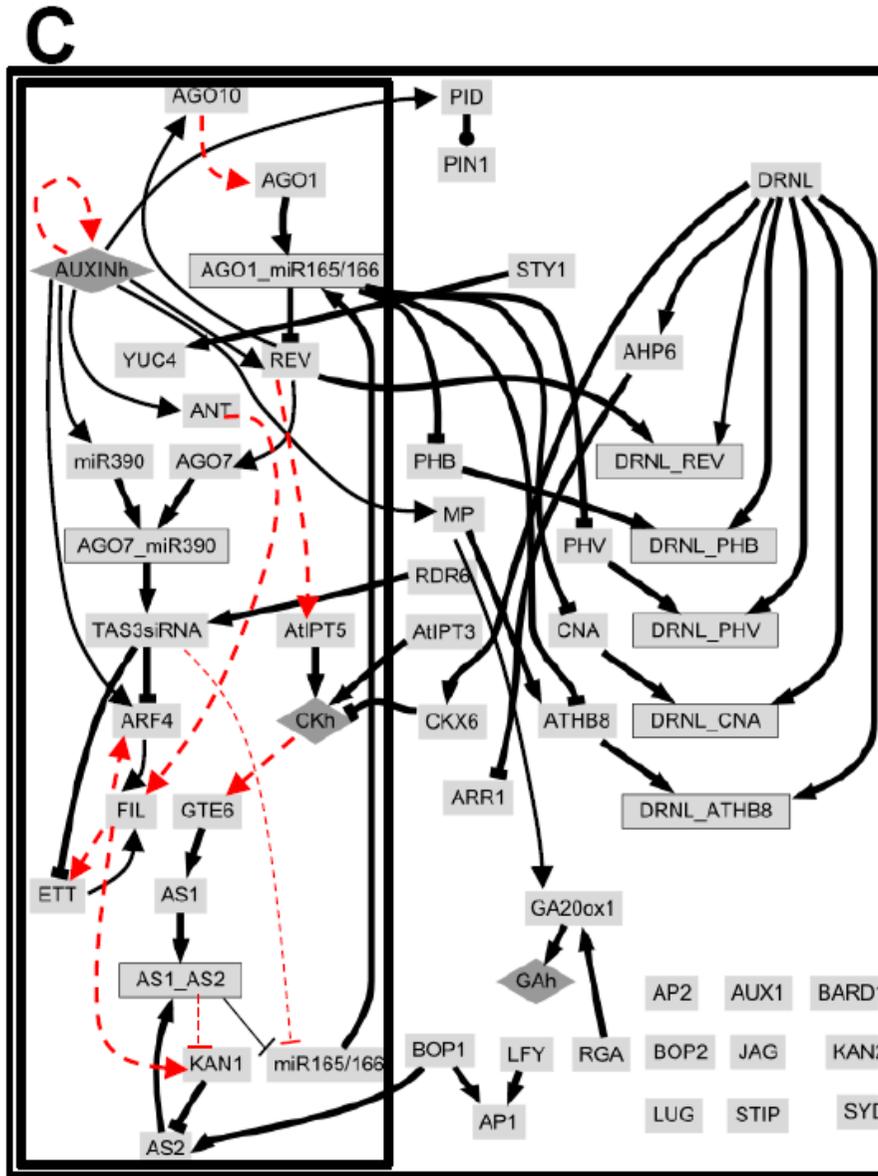

Example:  
Genetic evidence for a TF  
activating gene X

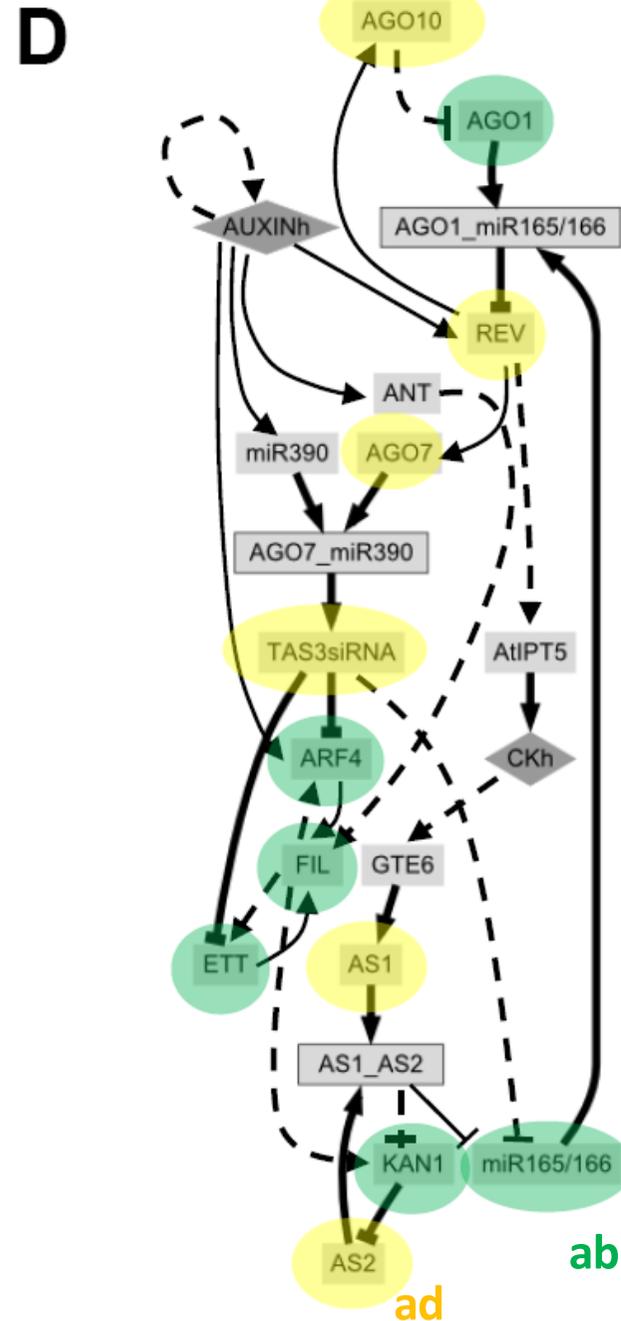

Does the promoter of gene X  
contain predicted binding  
site for the TF?

If yes, hypothesis of direct  
interaction

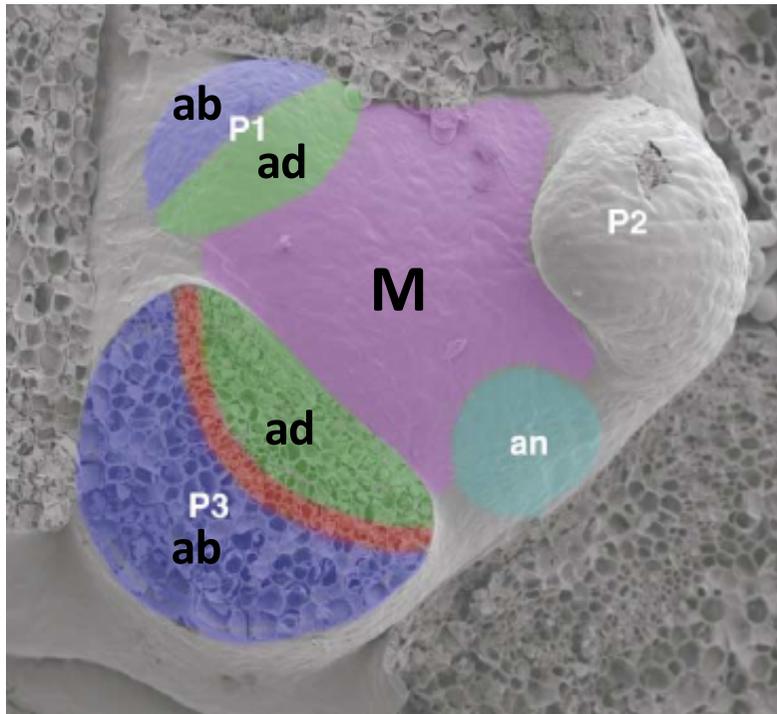

# Candidate molecular interaction graph

----- additional hypothesis of direct interaction

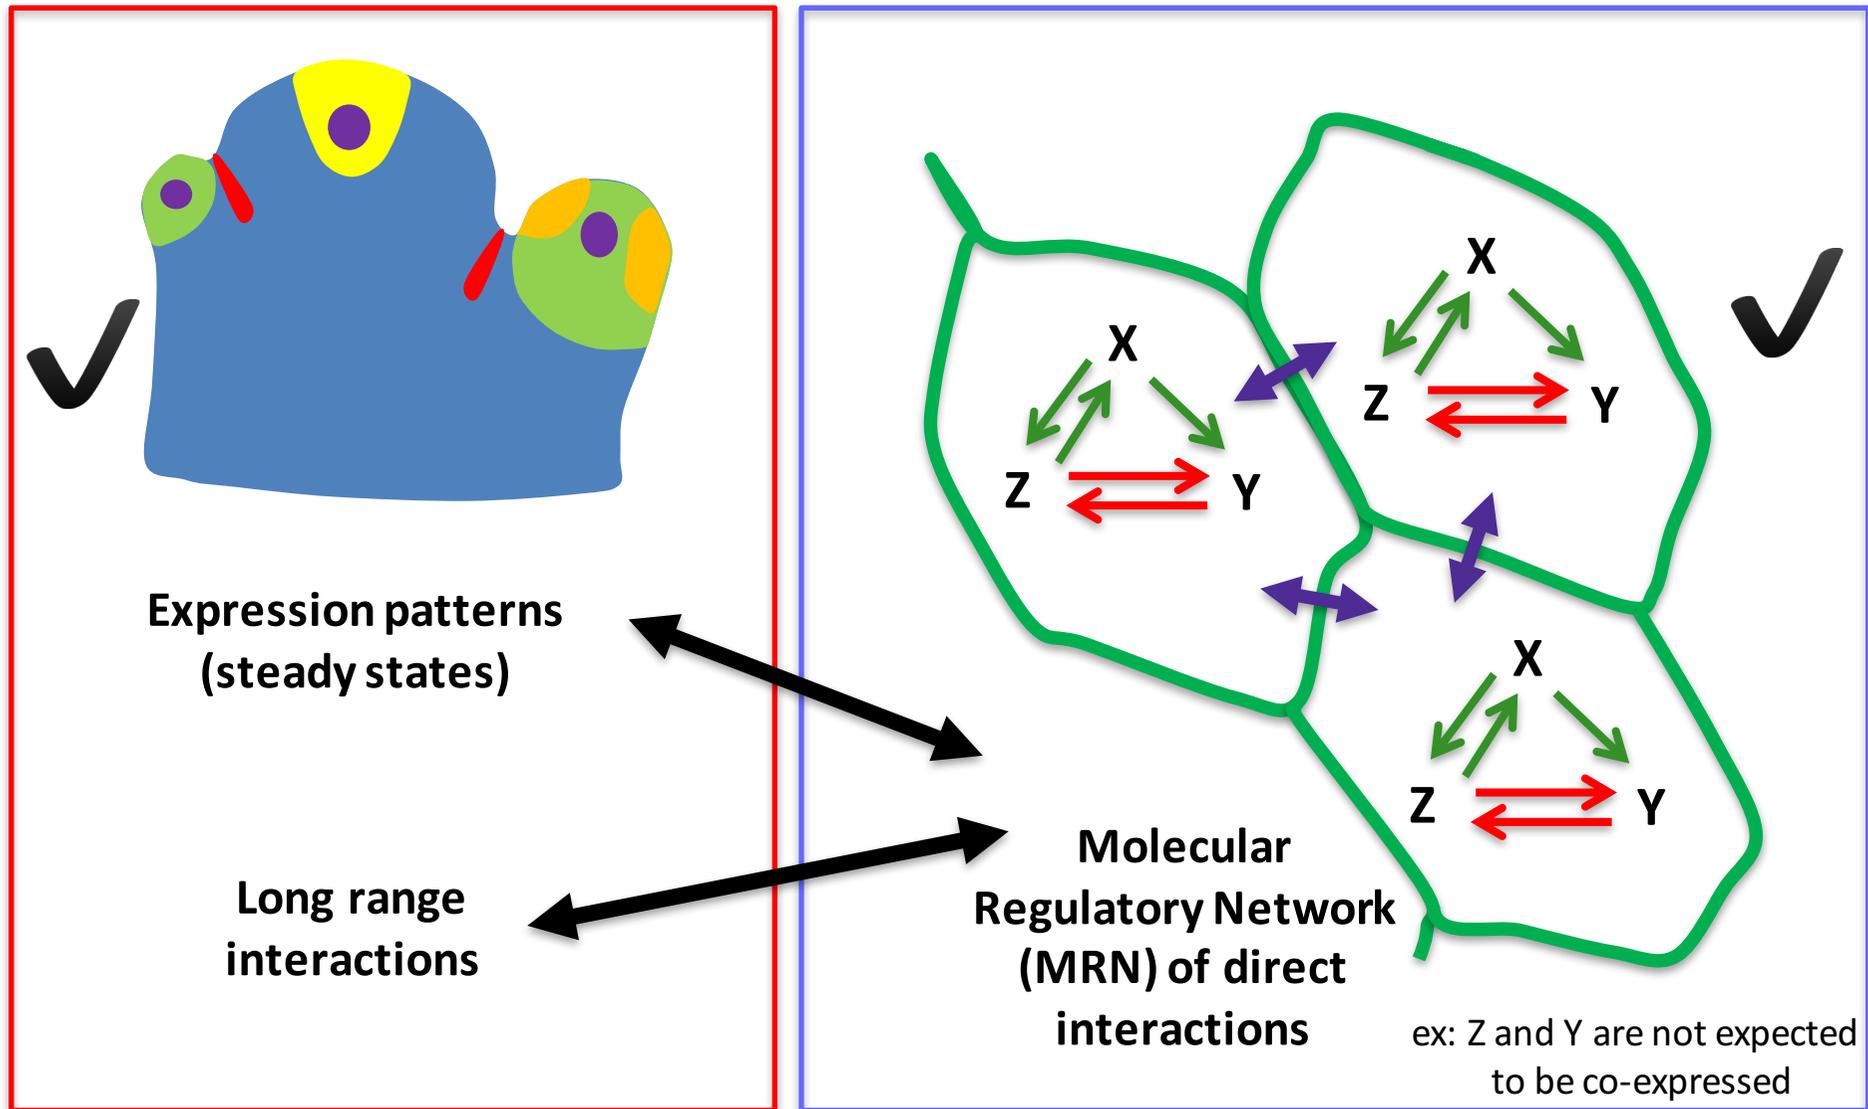

## Positional information

The adaxial side is closer to the meristem (adherent) compared to the abaxial side

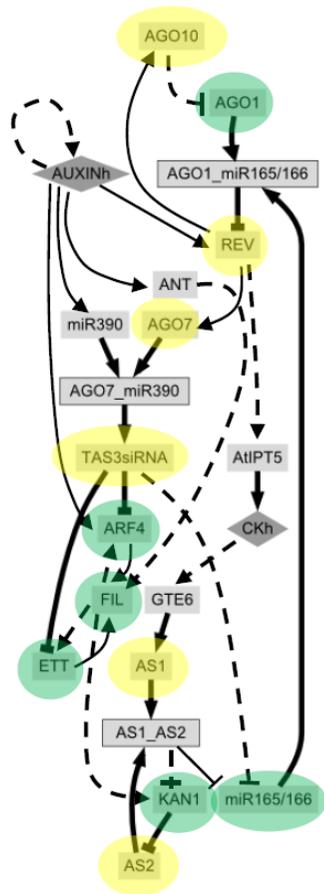

# Objective: construct a network which is coherent with expression patterns and long range interactions

**47 models can explain the data**

**Structure**

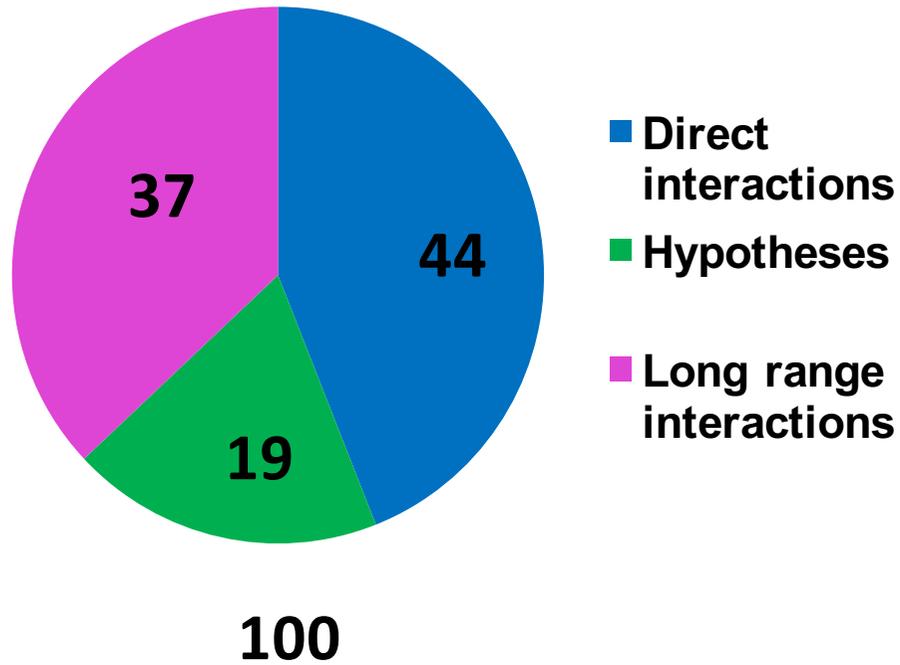

**Predictions of these models**

**Long range interactions**

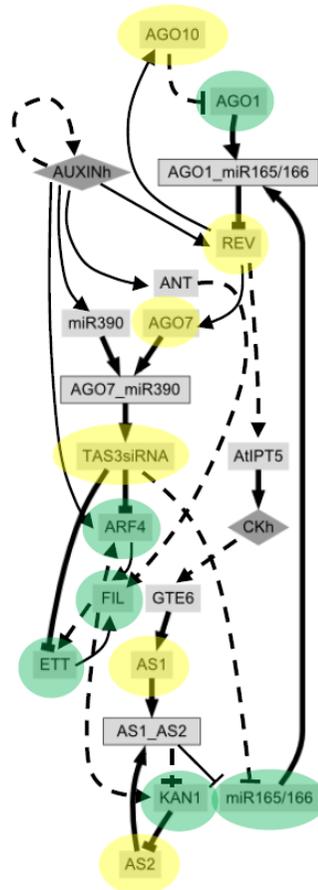

**Structure**

## Model validation

**37 genetic (indirect) interactions can be used to test the dynamics of the networks**

# Gain and loss-of-function mutations tested = 37 genetic interactions

Candidate molecular network

- 1- off(AGO10) → up(miR165), down(REV)
- 2- on(AGO10) → up(REV)
- 3- off(AGO7) → unchanged(FIL), up(ARF4,ETT)
- 4- off(AS1) → unchanged(FIL), up(ETT)
- 5- off(AS2) → up(ETT,FIL)
- 6- on(AS2) → down(FIL)
- 7- off(AS2,AGO10) → up(miR165), down(REV)
- 8- off(AS1,AGO7) → up(FIL)
- 9- off(AS2,AGO7) → up(miR165,FIL), down(REV)
- 10- off(ANT,FIL) → down(REV)
- 11- off(TAS3siRNA) → up(ETT,ARF4)
- 12- off(AS1,TAS3siRNA) → down(REV), up(miR165)
- 13- off(AS2,TAS3siRNA) → down(REV), up(miR165,FIL)
- 14- on(AUXIN) → down(CK), up(AtIPT5)
- 15- off(KAN1) → up(REV)
- 16- on(KAN1) → down(REV)
- 17- on(miR165) → down(AGO10), up(ETT,ARF4)
- 18- on(REV) → down (FIL, KAN1), up(AS2)
- 19- on(CK) → up(AS1)
- 20- on(FIL) → down(AS2)

# Model validation

For each of the 47 solutions, we  
run simulations of gain and loss of  
function

Model predictions

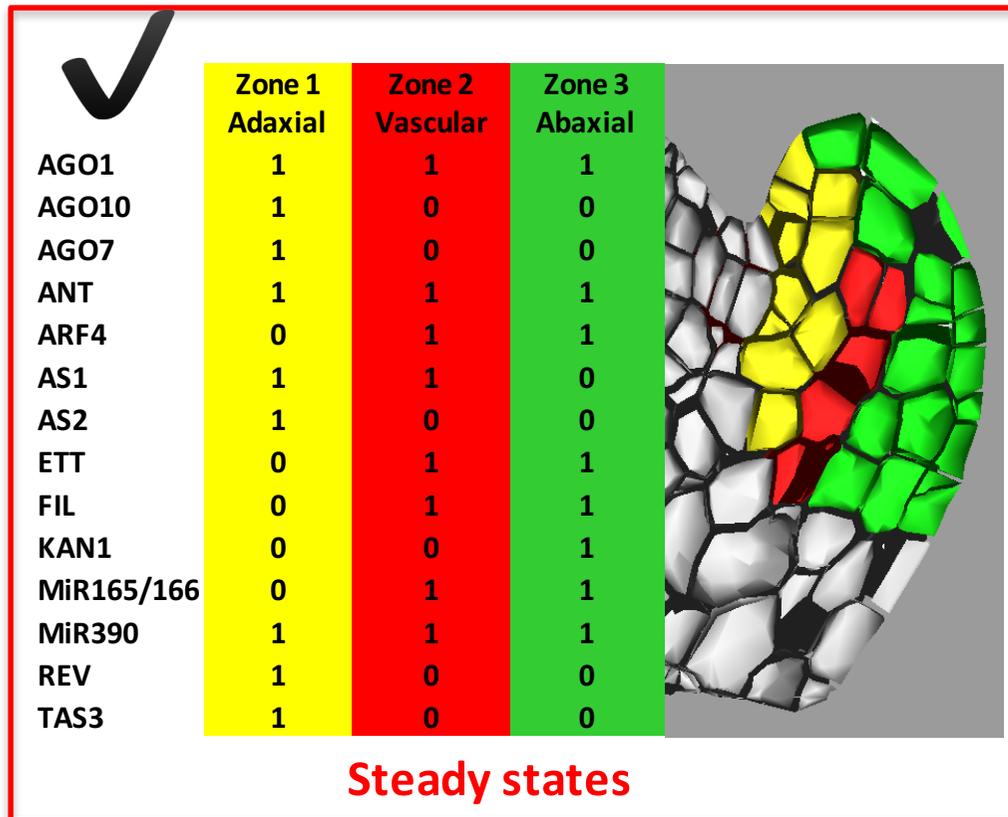

Experimental  
observations

# **Model validation**

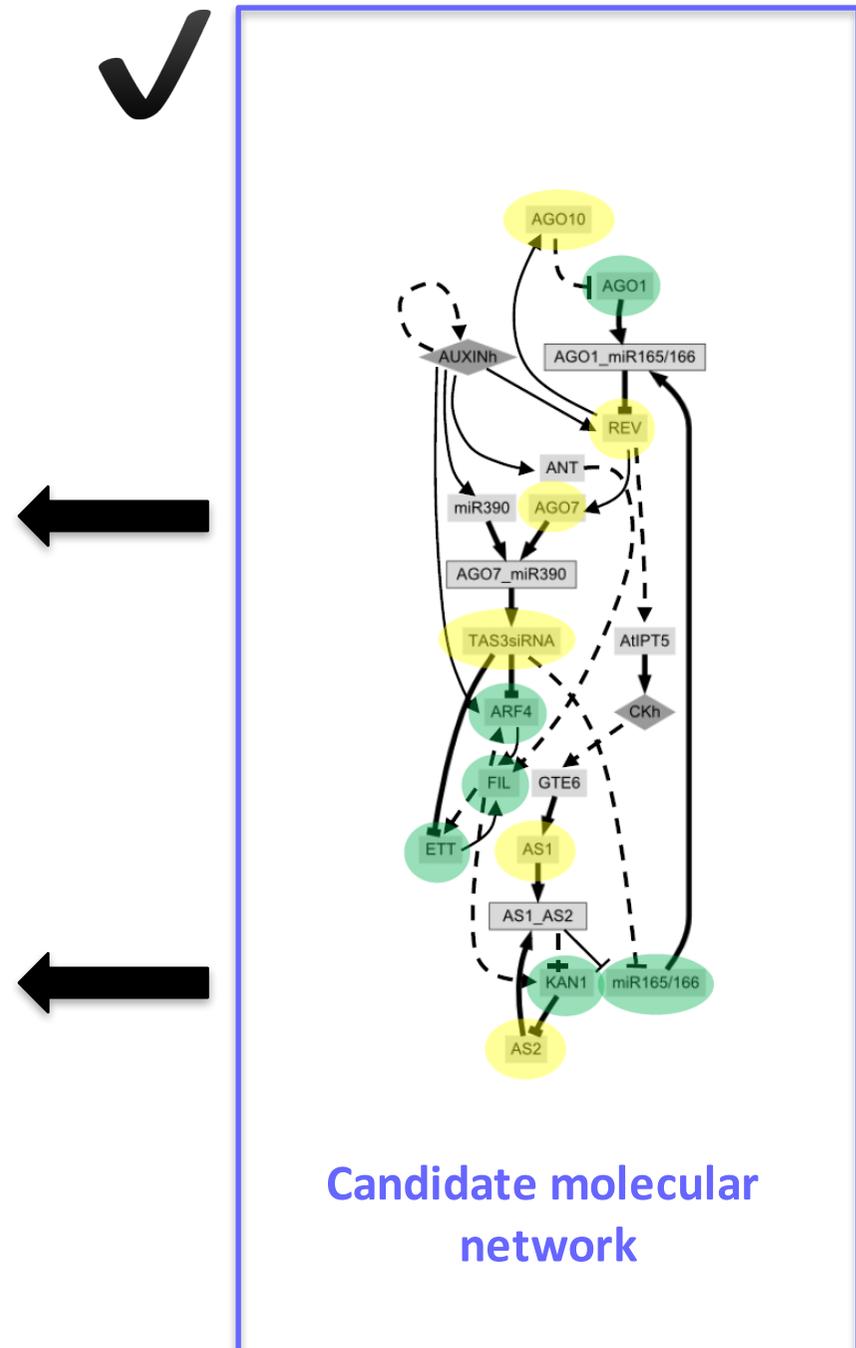

**35 (out of 37) indirect interactions predicted by the model were supported by experimental observations**

**The 47 solutions were all equally good**

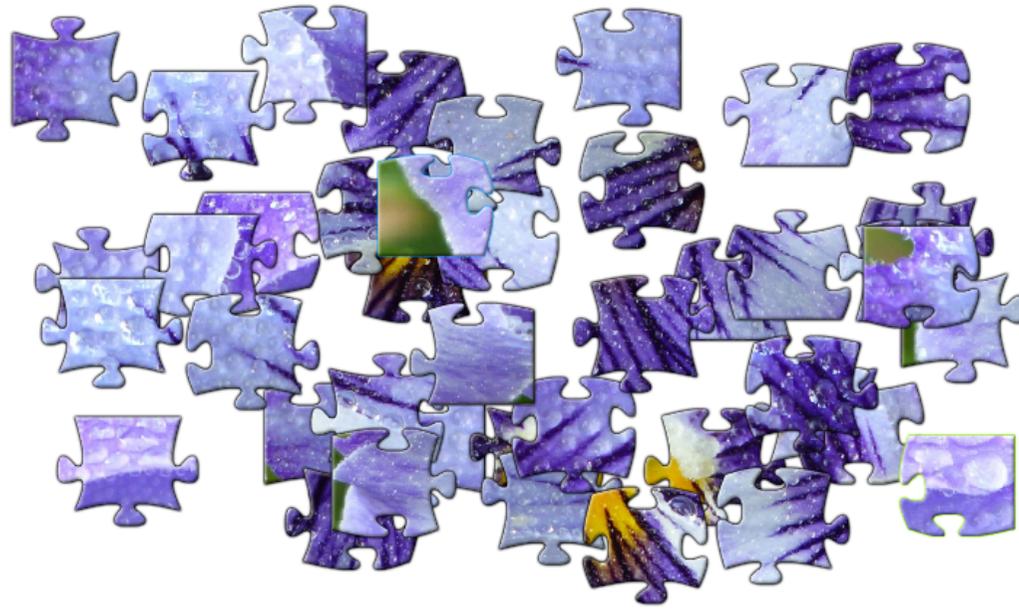

- 1- off(AGO10) → up(miR165), down(REV)
  - 2- on(AGO10) → up(REV)
  - 3- off(AGO7) → unchanged(FIL), up(ARF4,ETT)
  - 4- off(AS1) → unchanged(FIL), up(ETT)

**Behavior**

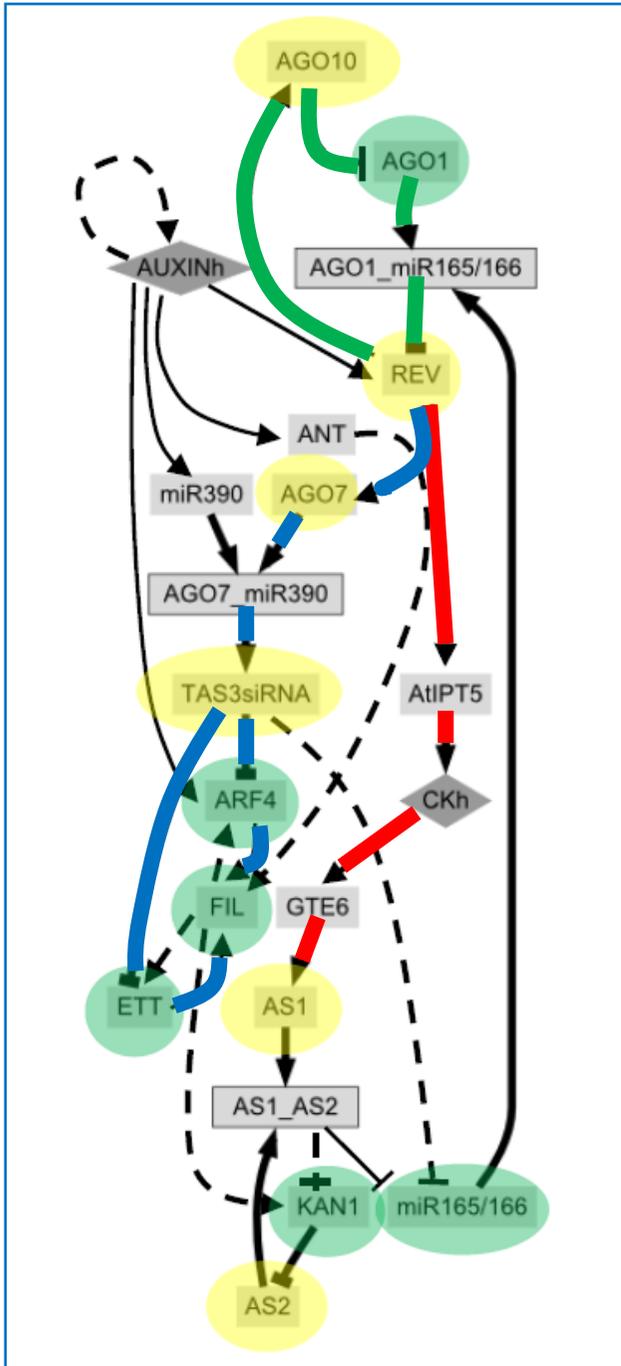

**Structure**

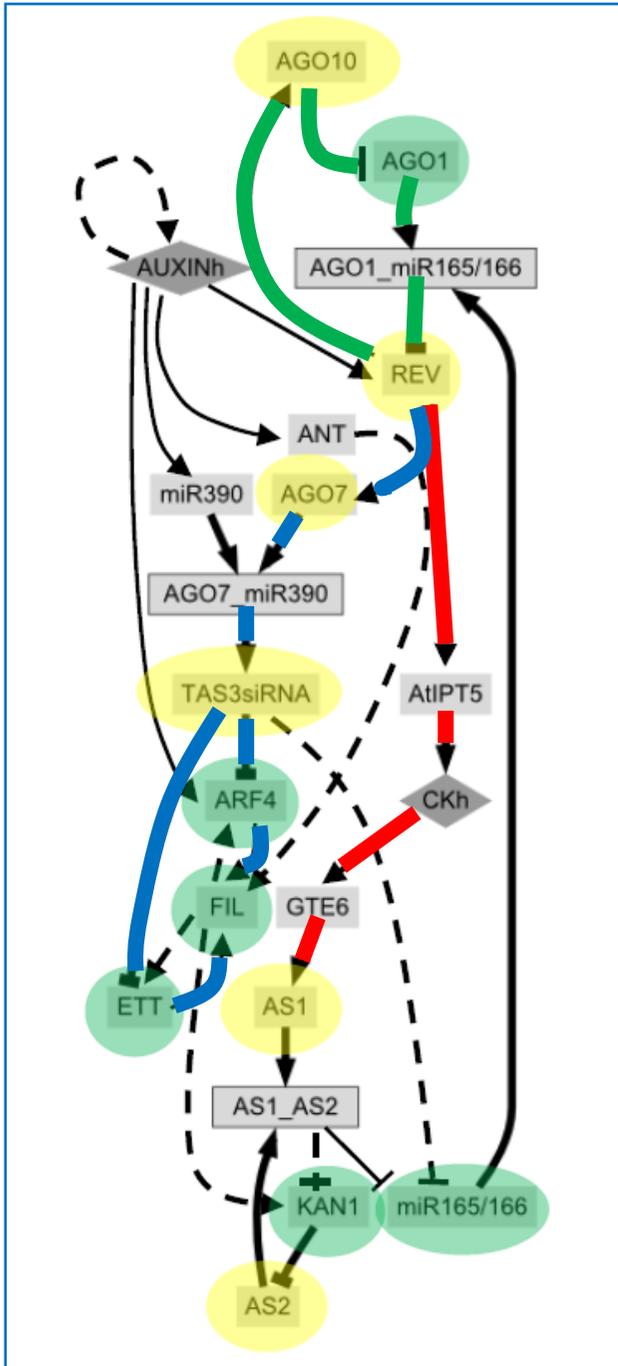

## What have we learned?

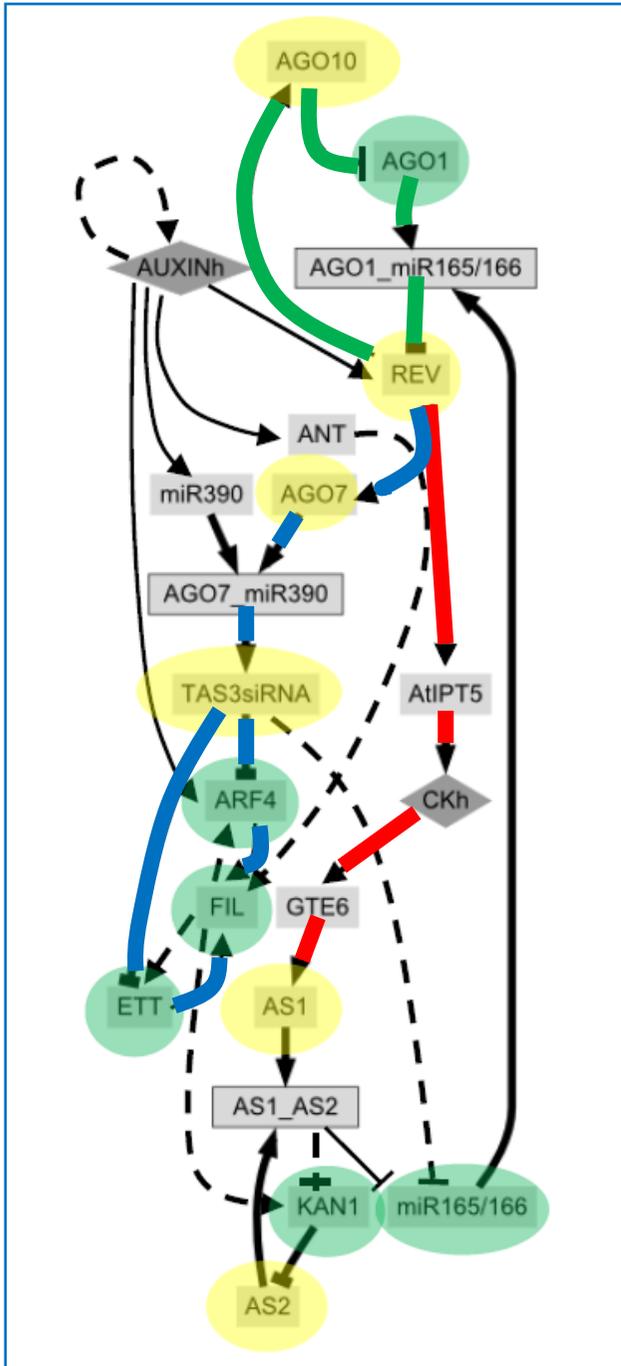

- Several unexpected potential pathways revealed (REV>AS1, REV>TAS3, REV>AGO1 and miR)
- several predictions for activation functions of the elements (e.g. FIL requires all inputs active)

## What have we learned?

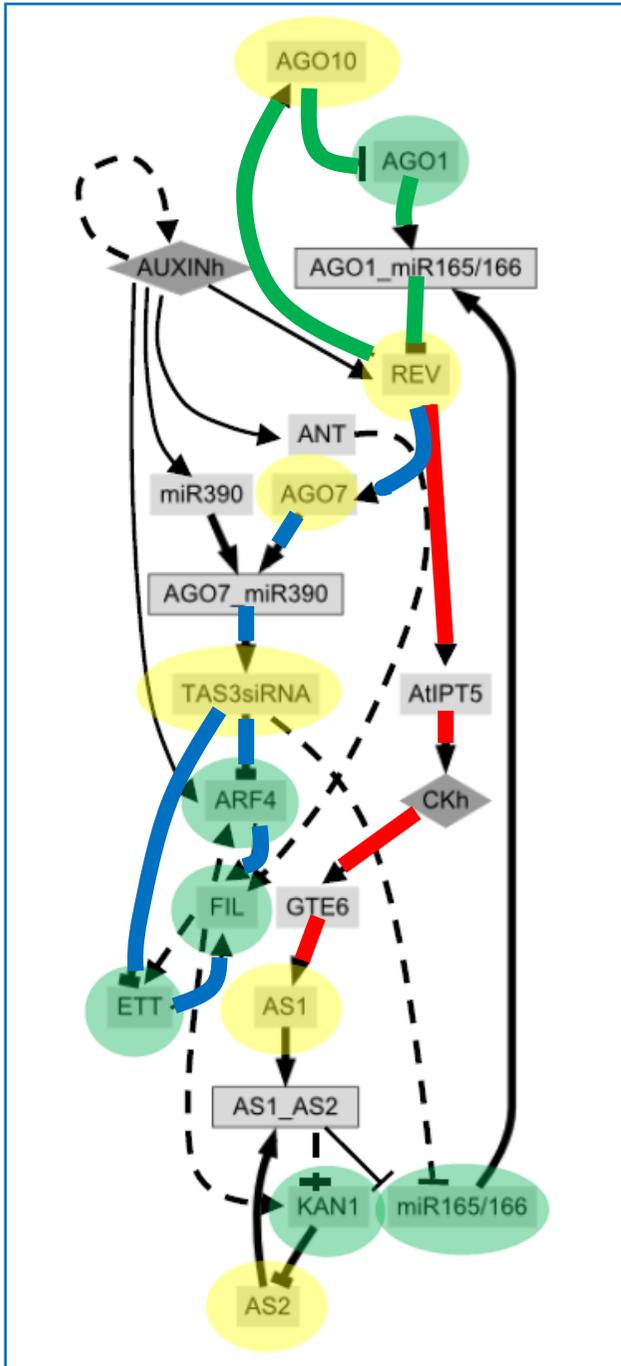

- Several unexpected potential pathways revealed (REV>AS1, REV>TAS3, REV>AGO1 and miR)
- several predictions for activation functions of the elements (e.g. FIL requires all inputs active)
- all assumptions and hypotheses are predictions that can be tested experimentally

## What have we learned?

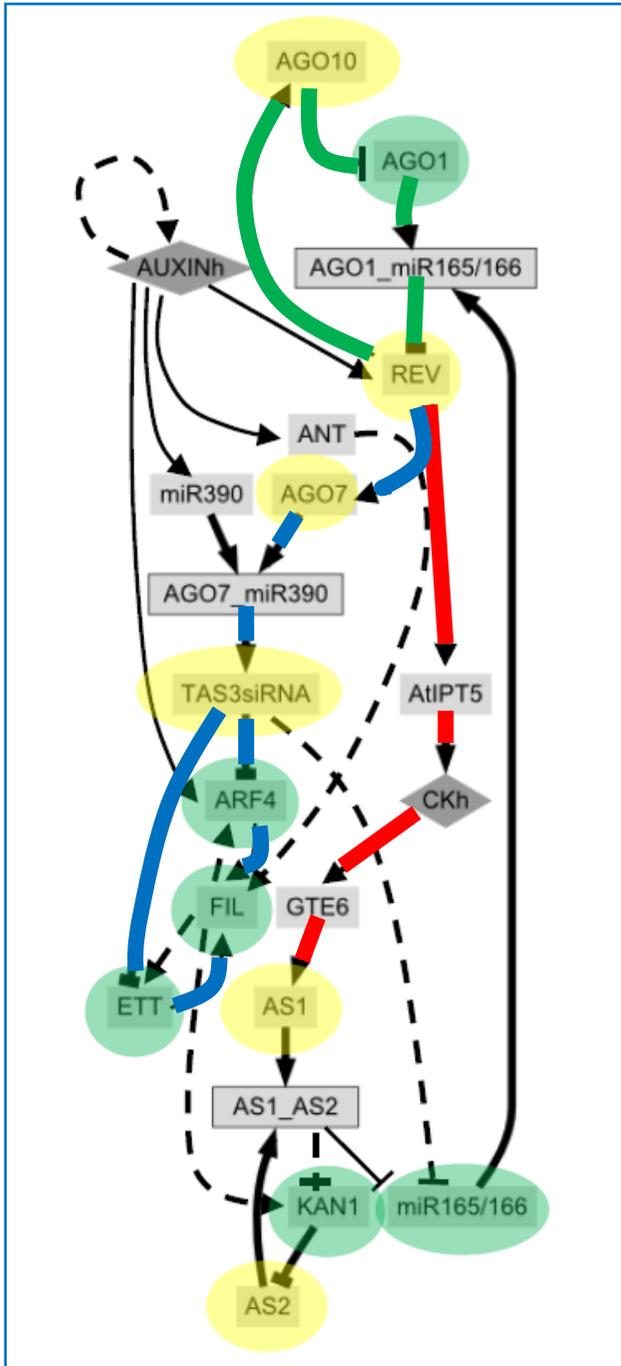

- Several unexpected potential pathways revealed (REV>AS1, REV>TAS3, REV>AGO1 and miR)
- several predictions for activation functions of the elements (e.g. FIL requires all inputs active)
- all assumptions and hypotheses are predictions that can be tested experimentally
- The available data are mostly coherent > this network probably account for adaxial and abaxial identities

## What have we learned?

- Several unexpected potential pathways revealed (REV>AS1, REV>TAS3, REV>AGO1 and miR)
- several predictions for activation functions of the elements (e.g. FIL requires all inputs active)
- all assumptions and hypotheses are predictions that can be tested experimentally
- The available data are mostly coherent > this network probably account for adaxial and abaxial identities
- Only based on published data !

## What have we learned?

- Several unexpected potential pathways revealed (REV>AS1, REV>TAS3, REV>AGO1 and miR)
- several predictions for activation functions of the elements (e.g. FIL requires all inputs active)
- all assumptions and hypotheses are predictions that can be tested experimentally
- The available data are mostly coherent > this network probably account for adaxial and abaxial identities
- Only based on published data !
- Can be implemented as new interactions are described
